Contents

Chapter 1  Overview of Alarms and Events ................................................................. 17
  About Alarms and Events ....................................................................................... 17
  About InTouch Alarms ......................................................................................... 18
    Alarm Priorities .................................................................................................. 18
    Alarm Sub-States ............................................................................................... 18
    Alarm Acknowledgement .................................................................................. 19
    Alarm Groups .................................................................................................... 19
  About InTouch Events ......................................................................................... 19
  Types of InTouch Alarms ..................................................................................... 20
    Discrete Alarms .................................................................................................. 20
    Analog Alarms .................................................................................................... 21
      Value Alarms .................................................................................................... 21
      Deviation Alarms ............................................................................................. 21
      Rate of Change Alarms ................................................................................... 22
  InTouch Distributed Alarm System .................................................................... 22
    Alarm Providers and Consumers ...................................................................... 24
      Alarm Provider ................................................................................................. 24
      Alarm Consumer ............................................................................................. 24
    Distributed Alarm Group Lists ......................................................................... 25
    Summary Alarms versus Historical Alarms ..................................................... 25
    Alarm Disablement, Inhibition, and Suppression ............................................. 25
    Terminal Services Alarm Support ..................................................................... 26
    Distributed Alarm System Data Storage .......................................................... 26

Chapter 2  Configuring Alarms ............................................................................... 29
  About Configuring Alarms ................................................................................... 29
  Defining Alarm Hierarchies .................................................................................. 29
    Creating an Alarm Group .................................................................................. 29
    Modifying an Alarm Group ................................................................................ 31
    Deleting an Alarm Group ................................................................................... 31
  Configuring Tags with Alarm Conditions ............................................................ 31
    Configuring Discrete Alarms .............................................................................. 31
    Configuring Value Alarms .................................................................................. 32
    Configuring Deviation Alarms .......................................................................... 33
    Configuring Rate of Change Alarms ................................................................... 34
    Disabling Alarms ............................................................................................... 35
    Inhibiting Alarms ............................................................................................... 35
  Setting Event Properties for Individual Tags ....................................................... 36
  Configuring Global Settings for Alarms and Events ........................................... 37
    Configuring the Alarm Buffer Size .................................................................... 37
    Enabling Events ................................................................................................. 38
    Making Alarm Enabling Retentive ..................................................................... 38
Chapter 3  Alarm Queries .......................................................................................... 41
About Alarm Queries ................................................................................................. 41
Example Alarm Queries ............................................................................................. 42
Getting More InTouch Query Information ................................................................. 43

Chapter 4  Viewing Current Alarms ......................................................................... 45
About Viewing Current Alarms ................................................................................... 45
Configuring an Alarm Viewer Control ...................................................................... 45
  Configuring the Appearance of the Grid ................................................................. 46
  Configuring the Font Display ................................................................................. 48
  Configuring Display Column Details .................................................................... 48
  Controlling Access to Features at Run Time .......................................................... 50
  Selecting the Alarms to Display ............................................................................ 52
  Using Query Favorites to Create Custom Saved Queries ..................................... 53
  Using Colors for Various Types of Alarm Records ................................................. 53
  Configuring the Shown Time Format of Alarm Records ....................................... 55
  Configuring the Sort Order of Alarm Records ...................................................... 56

Using an Alarm Viewer Control at Run Time ............................................................ 57
  Viewing Status Bar Information ............................................................................ 58
  Using Query Favorites at Run Time ...................................................................... 58

Using Alarm Viewer Control ActiveX Properties ..................................................... 60
  Configuring Colors for ActiveX Controls .............................................................. 65

Using Alarm Viewer Control ActiveX Methods ........................................................ 66
  Acknowledging Alarms During Run Time ............................................................... 66
    AckSelected() Method ....................................................................................... 66
    AckAll() Method .............................................................................................. 67
    AckVisible() Method ....................................................................................... 67
    AckSelectedGroup() Method .......................................................................... 67
    AckSelectedTag() Method ............................................................................... 68
    AckSelectedPriority() Method ....................................................................... 68
    AckGroup() Method ....................................................................................... 68
    AckPriority() Method .................................................................................... 69
    AckTag() Method ........................................................................................... 69

  Suppressing Alarms During Run Time ................................................................ 70
    ShowSuppression() Method .............................................................................. 70
    SuppressSelected() Method ............................................................................ 70
    SuppressAll() Method .................................................................................... 70
    SuppressVisible() Method .............................................................................. 71
    SuppressSelectedGroup() Method .................................................................. 71
    SuppressSelectedTag() Method ...................................................................... 71
    SuppressSelectedPriority() Method .................................................................. 71
    UnSuppressAll() Method ................................................................................ 71
    SuppressGroup() Method ............................................................................... 71
    SuppressPriority() Method ............................................................................. 72
    SuppressTag() Method ................................................................................... 72

  Retrieving Information About a Particular Alarm ................................................. 73
    GetItem() Method .......................................................................................... 73

Running Alarm Queries ............................................................................................ 73
  ShowQueryFavorites() Method ........................................................................... 73
Chapter 5  Acknowledging Alarms in Real Time .............................................. 81

About Acknowledging Alarms in Real Time ............................................... 81

Understanding Alarm Acknowledgement Models ...................................... 81
  Condition Acknowledgement Alarm Model .............................................. 81
  Expanded Summary Alarm Model ............................................................ 82
    Expanded Summary Alarm Records ...................................................... 82
    Using Expanded Summary Alarms ......................................................... 82
  Event-Based Alarm Model ........................................................................ 83
  Checking the Acknowledgement Model of a Tag at Run Time .................... 83
    AlarmAckModel Dotfield ........................................................................ 83

Using Dotfields to Acknowledge Alarms ..................................................... 84

  Acknowledging Alarms or Alarm Groups ................................................. 84
    Ack Dotfield ......................................................................................... 84
    UnAck Dotfield .................................................................................... 85
  Acknowledging Value Alarms .................................................................... 85
    AckValue Dotfield ................................................................................ 85
  Acknowledging Discrete Alarms ............................................................... 86
    AckDsc Dotfield ................................................................................... 86
  Acknowledging Deviation Alarms .............................................................. 87
    AckDev Dotfield ................................................................................... 87
  Acknowledging Rate-of-Change Alarms ..................................................... 88
    AckROC Dotfield .................................................................................. 88

Using Script Functions to Acknowledge Alarms .......................................... 88

  Ack() Function ....................................................................................... 89
Using Automatic Acknowledgement When the Tag Value Returns to Normal .......................... 89
Using Alarm Clients to Acknowledge Alarms ......................................................................... 90
Using Alarm and Acknowledgement Comments ................................................................... 90

Chapter 6  Controlling Alarm Properties of Tags and Groups at Run Time .................. 93

About Controlling Alarm Properties of Tags and Groups at Run Time ............................. 93

Determining if Tags or Alarm Groups are in an Alarm Condition ......................................... 97
  $NewAlarm System Tag ....................................................................................................... 98
  $System System Tag ........................................................................................................... 98
  .Alarm Dotfield .................................................................................................................. 99
  .Normal Dotfield ............................................................................................................... 99
  .AlarmDesc Dotfield .......................................................................................................... 100
  .AlarmDev Dotfield ............................................................................................................ 101
  .AlarmROC Dotfield .......................................................................................................... 101
  .LoStatus Dotfield ............................................................................................................ 102
  .LoLoStatus Dotfield ......................................................................................................... 103
  .HiStatus Dotfield ............................................................................................................. 103
  .HiHiStatus Dotfield ......................................................................................................... 104
  .MinorDevStatus Dotfield ................................................................................................. 105
  .MajorDevStatus Dotfield ................................................................................................. 105
  .ROCStatus Dotfield ......................................................................................................... 106

Reverting Alarm Status Handling to InTouch 7.1 Behavior ................................................ 106

Determining if Alarm Limits Are Set for Tags .................................................................... 107
  .LoLoSet Dotfield .............................................................................................................. 107
  .LoSet Dotfield .................................................................................................................. 108
  .HiSet Dotfield .................................................................................................................. 108
  .HiHiSet Dotfield .............................................................................................................. 109
  .MinorDevSet Dotfield ...................................................................................................... 109
  .MajorDevSet Dotfield ...................................................................................................... 110
  .ROCSet Dotfield .............................................................................................................. 110

Enabling and Disabling Alarms for a Tag or Alarm Group ............................................ 111
  Enabling/Disabling All Alarms .......................................................................................... 111
    .AlarmEnabled Dotfield ................................................................................................. 111
    .AlarmDisabled Dotfield ............................................................................................... 112
  Enabling/Disabling LoLo Alarms ..................................................................................... 112
    .AlarmLoLoEnabled Dotfield ......................................................................................... 112
    .AlarmLoLoDisabled Dotfield ....................................................................................... 113
  Enabling/Disabling Low Alarms ...................................................................................... 114
    .AlarmLoEnabled Dotfield ............................................................................................ 114
    .AlarmLoDisabled Dotfield .......................................................................................... 114
  Enabling/Disabling High Alarms ..................................................................................... 115
    .AlarmHiEnabled Dotfield ............................................................................................ 115
    .AlarmHiDisabled Dotfield ......................................................................................... 116
  Enabling/Disabling HiHi Alarms ..................................................................................... 117
    .AlarmHiHiEnabled Dotfield ......................................................................................... 117
    .AlarmHiHiDisabled Dotfield ....................................................................................... 117
  Enabling/Disabling Discrete Alarms ............................................................................... 118
    .AlarmDscEnabled Dotfield ......................................................................................... 118
    .AlarmDscDisabled Dotfield ......................................................................................... 119
  Enabling/Disabling Minor Deviation Alarms .................................................................... 119
    .AlarmMinDevEnabled Dotfield .................................................................................... 120
Chapter 7  Viewing Alarm Hierarchies

About Viewing Alarm Hierarchies ........................................... 145

Configuring an Alarm Tree Viewer Control ............................ 146
   Configuring the Appearance and Colors ............................... 146
   Configuring Fonts .......................................................... 147
   Configuring Automatic Refresh ........................................ 148

Chapter 8 Printing Alarms ...................................................................... 163

About Printing Alarms ............................................................................. 163
Configuring Alarm Printing and Logging ................................................ 163
Configuring Printer Settings .................................................................... 164
Configuring Alarm Print Commands ....................................................... 165
Print Command Settings ........................................................................ 165
Sample Printer Command Sequences ..................................................... 166
Printer Command Escape Sequences Syntax .......................................... 166
Entering Names of Control Characters .................................................... 167
Entering Printable Characters .................................................................. 167
Entering a Character’s Decimal Number .................................................. 167
Entering a Character’s Hexadecimal Number ........................................... 167
Configuring Which Alarms to Print ................................................................. 167
Configuring the Format of Print and File Output ................................................. 168
Configuring Log Files for Alarms ......................................................................... 171
Saving and Loading Configuration Files ............................................................. 173
About Printing Alarms With the Alarm Printer ...................................................... 173
Logging Alarms to a File ....................................................................................... 174
Starting Alarm Printer with a Specific Configuration ........................................... 174
Controlling the Alarm Printer Using Scripting ....................................................... 175
Stopping and Starting an Alarm Printer Instance or Query .................................. 176
APUStartInstance() Function .............................................................................. 176
APUStartQuery() Function ................................................................................ 176
APUStopInstance() Function ............................................................................. 177
APUStopQuery() Function ................................................................................ 178
Querying Alarm Query Information ..................................................................... 178
APUGetAlarmGroupText() Function ..................................................................... 178
APUGetQueryFromPriority() Function .................................................................. 179
APUGetQueryToPriority() Function .................................................................... 179
APUGetConfigurationFilePath() Function ........................................................... 180
APUGetPrinterJobCount() Function ................................................................... 181
APUGetQueryAlarmState() Function .................................................................... 181
APUGetQueryProcessingState() Function ........................................................... 182
Querying Instance Information .......................................................................... 182
APUFindAlarmGroupInstance() Function ............................................................ 183
APUFindFileInstance() Function ......................................................................... 183
APUFindPrinterInstance() Function ..................................................................... 184
APUGetInstanceCount() Function ........................................................................ 184
APUsInstanceUsed() Function ........................................................................... 185
Querying Printer Information ............................................................................. 185
APUGetPrinterName() Function ......................................................................... 186
APUGetPrinterStatus() Function ........................................................................ 186
Setting Alarm Query Information ....................................................................... 187
APUSetAlarmGroupText() Function .................................................................... 187
APUSetQueryAlarmState() Function .................................................................... 188
APUSetQueryFromPriority() Function .................................................................. 188
APUSetQueryToPriority() Function .................................................................... 189
APUSetTimeoutValues() Function ...................................................................... 189
Handling Alarm Printer Errors ............................................................................ 190
APUTranslateErrorCode() Function ..................................................................... 190
Chapter 9  Recording Alarms into an Alarm Database ....................................... 191
About Recording Alarms into an Alarm Database ............................................... 191
SQL Server Accounts for Alarm DB Logger Manager ........................................... 191
Using the Alarm DB Logger Manager .................................................................. 192
Configuring Alarm Database Logging ............................................................... 192
Establishing the Database Connection ............................................................... 192
Configuring Which Alarms to Log ...................................................................... 194
Configuring the Logging Interval ........................................................................ 195
Configuring Alarm DB Logger as a Service ......................................................... 196
Starting and Stopping Alarm Database Logging .................................................. 197
Alarm Database Views ......................................................................................... 198

Overview of Alarms and Events

About Alarms and Events

You can create InTouch applications that generate alarms and events to notify operators about the status of process activity.

- Alarms warn run-time operators about process conditions that could potentially cause problems. Typically, you set up an alarm to trigger when a process value exceeds a defined limit. An operator must usually acknowledge the alarm.

- Events represent normal system status messages. A typical event is when a system condition occurs, such as an operator logging on to an InTouch application. Operators do not have to acknowledge events.

The following figure shows how the InTouch HMI handles alarms and events while an application is running. Alarm and event data is saved to the alarm database.

You can configure any tag for event monitoring. An event message is logged to the alarm system each time the tag value changes. The event message includes how the value changed and whether the operator, I/O, scripts, or the system initiated the change.
About InTouch Alarms

Alarms represent warnings of process conditions that could cause problems and require an operator response. A typical alarm is triggered when a process value exceeds a user-defined limit, such as an analog value exceeding an upper threshold. This triggers an alarm to notify the operator of a problem. After the operator acknowledges the alarm, the InTouch HMI recognizes the alarm has been acknowledged.

You can configure the InTouch HMI to require an alarm to be acknowledged even if the condition causing the alarm has passed. This ensures that an operator is aware of events that caused a temporary alarm state but have returned to normal.

The main alarm states are described in the following table:

<table>
<thead>
<tr>
<th>Alarm State</th>
<th>Condition</th>
</tr>
</thead>
<tbody>
<tr>
<td>ACK</td>
<td>Alarm was acknowledged.</td>
</tr>
<tr>
<td>ALM</td>
<td>Alarm has occurred.</td>
</tr>
<tr>
<td>RTN</td>
<td>Tag returned from an alarm state to a normal state.</td>
</tr>
</tbody>
</table>

Alarm Priorities

You assign a level of priority, or severity, to an alarm. A boiler temperature limit, for example, would require a high-priority alarm, requiring immediate attention. An end of a shift alarm is a much less severe. The alarm priority usually depends upon the circumstances—the factory application, the nature of the equipment, safety, availability of backup systems, potential costs of damage, or downtime.

You assign an alarm priority when you define a tag. The priority can range from 1 to 999, with 1 being the most severe.

You can designate a range of alarm priorities to represent a classification of alarms. For example, if a process requires four levels of severity, you can create four priority ranges.

<table>
<thead>
<tr>
<th>Alarm Severity</th>
<th>Priority Range</th>
</tr>
</thead>
<tbody>
<tr>
<td>Critical</td>
<td>1 – 249</td>
</tr>
<tr>
<td>Major</td>
<td>250 – 499</td>
</tr>
<tr>
<td>Minor</td>
<td>500 – 749</td>
</tr>
<tr>
<td>Informational</td>
<td>750 – 999</td>
</tr>
</tbody>
</table>

Ranges are useful for alarm filtering. For example, you can configure an alarm display to filter out all but the critical alarms. You can create animation links, acknowledgment scripts, and filtered viewing and printing, all based on the alarm priority range.

Alarm Sub-States

A multi-state alarm includes a range of alarm sub-conditions. For example, an analog alarm typically has several limits.

- A High and Low threshold set the boundaries for the normal operating range.
• HiHi and LoLo limits mark the extreme deviations from the normal range of values.

A boiler temperature level can be in the alarmed condition for any one of these sub-states. The boiler temperature can also transition between any two sub-states while continuing to remain in the overall alarmed condition.

Alarm Acknowledgement

When an alarm occurs, the runtime operator (or system) must acknowledge the alarm. Acknowledgement merely indicates that someone is aware of the alarm. This is separate from taking corrective action, which might not happen right away. It is also separate from whether the alarm condition returns to normal—which it might do on its own, even without any external intervention.

A high or medium priority alarm usually requires immediate acknowledgment, while a very low-priority alarm might not. Although the condition that generated the alarm may go away (for example, a temperature rises too high and then becomes lower again), the alarm itself is not considered resolved until it is acknowledged.

Alarm Groups

You can group alarms to make tracking and management easier. Alarm groups are logical representations of different areas of a factory, pieces of equipment, operator responsibility, or a manufacturing process.

For example, the following figure shows a three-tier alarm group hierarchy for a tank farm application.

```
System
  TnkFrm1
    F1Tk1Lv1
  TnkFrm2
    F2Tk1Lv1
    F2Tk2Lv1
  TnkFrm3
    F3Tk1Lv1
    F3Tk2Lv1
```

Alarm groups are useful for filtering in alarm displays, alarm printers, and acknowledgment scripts.

Every tag is associated with an alarm group. By default, tags are assigned to main $System group. You can create a hierarchy of additional alarm groups under the $System group, up to a maximum of 32 levels.

You create alarm groups and associate tags with them while you are defining your tags in the Tagname Dictionary.

Alarm groups and group variables are not compatible with SmartSymbols. You can't use references to alarm groups or group variables in a SmartSymbol.

About InTouch Events

An event is a detectable occurrence of something happening within the system, which may or may not be associated with an alarm. A transition into or out of an alarmed state is one kind of event. An event might also be an operator action, a change to the system configuration, or some kind of system error.

An event is different than a condition. A condition can persist for minutes, hours, days, or weeks. An event is momentary; it takes place and is immediately over. An alarm is a condition; an alarm notification is an event.

Events represent normal system status messages and do not require an operator response.

When you define a tag to do event monitoring, you can choose to have event messages printed or logged to the alarm system each time the tag value changes. The event message includes how the value changed and whether the operator, I/O, scripts or the system initiated the change.
An event can be one of the following types:

<table>
<thead>
<tr>
<th>Event</th>
<th>Condition</th>
</tr>
</thead>
<tbody>
<tr>
<td>OPR</td>
<td>The operator modified the tag value using the Value input.</td>
</tr>
<tr>
<td>LGC</td>
<td>A QuickScript modified the tag value.</td>
</tr>
<tr>
<td>DDE</td>
<td>The tag value was poked from a DDE client.</td>
</tr>
<tr>
<td>PROT</td>
<td>The tag value change was initiated from an ArchestrA graphic, either from a custom property or from a pushbutton in the ArchestrA graphic.</td>
</tr>
<tr>
<td>SYS</td>
<td>A system event occurred.</td>
</tr>
<tr>
<td>USER</td>
<td>$Operator changed.</td>
</tr>
</tbody>
</table>

The SYS and USER events are generated by the system regardless of whether event logging is enabled for any tags. DDE, OPR, and LGC events relate to tag values and are only generated for tags that have event logging enabled.

**Types of InTouch Alarms**

Within the InTouch HMI, alarms are classified into general categories based on their characteristics. These categories are known as Class and Type. The Distributed Alarm system categorizes all alarms into five general conditions: Discrete, Value, Deviation, Rate-of-Change, and SPC.

<table>
<thead>
<tr>
<th>Alarm Condition</th>
<th>Distributed Class</th>
<th>Distributed Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Discrete</td>
<td>DSC</td>
<td>DSC</td>
</tr>
<tr>
<td>Value - LoLo</td>
<td>VALUE</td>
<td>LOLO</td>
</tr>
<tr>
<td>Value - Low</td>
<td>VALUE</td>
<td>LO</td>
</tr>
<tr>
<td>Value - High</td>
<td>VALUE</td>
<td>HI</td>
</tr>
<tr>
<td>Value - HiHi</td>
<td>VALUE</td>
<td>HIHI</td>
</tr>
<tr>
<td>Deviation - Major</td>
<td>DEV</td>
<td>MAJDEV</td>
</tr>
<tr>
<td>Deviation - Minor</td>
<td>DEV</td>
<td>MINDEV</td>
</tr>
<tr>
<td>Rate-of-Change</td>
<td>ROC</td>
<td>ROC</td>
</tr>
<tr>
<td>SPC</td>
<td>SPC</td>
<td>SPC</td>
</tr>
</tbody>
</table>

You associate each InTouch tag with an alarm condition when you define the tag. Depending upon a tag’s type, you can define one or more of the alarm classes or types for it.

**Discrete Alarms**

A discrete alarm corresponds to a discrete tag with two possible states. When you create a discrete tag, you configure whether the alarmed state corresponds to the true or false state of the tag.
Analog Alarms

An analog alarm corresponds to an analog tag, which is associated with an integer or real number. Within the analog alarm type, there are several sub-types: value, deviation, and rate-of-change.

Value Alarms

The current tag value is compared to one or more predetermined limits. If the value exceeds the limit, the alarmed state is declared. You can individually configure values and priorities for the "LoLo" limit, "Lo" limit, "Hi" limit, and "HiHi" limit, and indicate whether or not each limit is to be used.

Deviation Alarms

The current tag value is compared to a target value, and then the absolute value of the difference is compared to one or more limits, expressed as a percent of the range of the tag value.

You can individually configure values and priorities for the minor deviation limit and the major deviation limit, and indicate whether or not each limit is to be used. You can also configure a value for a deviation deadband, also expressed as a percent of the tag’s range. This controls the percentage (of the total range) that the tag value must change before it is evaluated to be in alarm.

For example, you configure limits as follows:

- Range of 0 to 100
- Target of 50
- Minor deviation of 10 percent, which sets the minor deviation thresholds at 40 and 60.
- Major deviation of 20 percent, which sets the major deviation thresholds at 30 and 70.
- Deadband of 10 percent

If the tag value is 39, a minor deviation alarm occurs. However, the value must change at least to 50 (40 plus the deadband of 10) before the alarm is evaluated and cleared.

If the tag value is 72, a major deviation alarm occurs. The value drop to at least 61 before the alarm is cleared.
Rate of Change Alarms

A tag’s current and previous values are compared over a measured period. The rate of change of a tag’s value is calculated using the previous tag value, the time of the previous change, the current tag value, and the current time.

A tag is tested for a rate-of-change alarm whenever its value changes. The one exception is the initial tag value when an application starts running in WindowViewer. In that case, the initial value is ignored and the first rate of change comparison is made between the second and third changes in a tag’s value. Thereafter, rate of change measurements are made between consecutive tag value changes.

If the absolute difference in values between consecutive tag changes exceeds a specified limit, a rate of change alarm occurs. The rate of change limit is expressed as a percentage of the tag’s value over a time interval, which can be per second, per minute, or per hour. You can configure the value and priority of the ROC limit, and whether or not the limit is to be used.

InTouch Distributed Alarm System

The Distributed Alarm system is made up of:

- An Alarm Manager, which manages currently active alarms (summary alarms) and historical alarms and events. The summary and historical alarms are held in the InTouch internal alarm memory.
- An Alarm DB Logger, which stores historical alarms and events to the alarm database. The alarm database is a SQL Server database.
- An Alarm Printer, which prints historical alarms and events.
- A set of ActiveX controls, which retrieve alarms and events from either the internal alarm memory or the alarm database at run time.
The following figure shows an overview of the system.

Important: The Distributed Alarm system runs as a set of Windows services. To reduce the security exposure of running the Distributed Alarm system with administrator privileges, the user account permissions have been set to non-interactive for these services.

Run time operators can use the Distributed Alarm system to:

- Show, log, and print alarms and events generated by a local InTouch application and by alarm systems of other networked applications.
- Acknowledge alarms locally or from a remote network node.
- Use the alarm ActiveX controls in your InTouch applications to show alarm displays that you pre-configure.
- Provide more feedback about the alarm using a separate alarm comment field.

As an application developer, you can:

- Control the alarms through dotfields.
- Configure your alarms so that they are enabled or disabled directly or indirectly under full control of the application. You can apply alarm suppression to single alarm classes, tags, or groups to prohibit the showing of alarm information on a specific view node. System-wide disablement can block alarm activity at the source.
- Configure alarm information to be logged to history. The Alarm DB Logger can run as a Windows service or be manually started on demand. Alarm logging uses UTC (GMT) time stamping and provides compatibility with DST and across time zones.
• Set up failover alarm providers. If a primary alarm provider fails, the Distributed Alarm system seamlessly acquires alarm information from the backup system. On reconnection of the primary node, the Distributed Alarm system ensures that alarm acknowledgements are re-synchronized prior to the returning primary system becoming live.

The Distributed Alarm system:
• Sends data through the SuiteLink protocol and uses a minimal amount of CPU and network resources.
• Time stamps the alarm at the time the alarm occurs, not when the consumer receives the alarm. The time stamp includes milliseconds.

Alarm Providers and Consumers

On any given node there can be a collection of Alarm Providers (Publishers) and Alarm Consumers (Subscribers). The InTouch Distributed Alarm system provides the communication link to pass alarm information between nodes and software components.

Alarm Provider

An alarm provider:
• Keeps track of alarmable items—that is, items that can transition into an alarmed condition—and provides the Distributed Alarm system with the list of these items, including information on any hierarchical grouping of the items.
• Notifies the Distributed Alarm system when the status of an alarm item changes. Status changes include whether the item is in or out of the alarmed state and whether the most recent alarm has been acknowledged.
• Keeps track of whether an alarm item is disabled.

The InTouch HMI supports external alarm providers, such as QI Analyst, an ArchestrA Galaxy, and other software built with the Alarm API toolkit. The date/time stamp for these alarm records is provided by the alarm provider, and is not generated by the Distributed Alarm system.

Alarm Consumer

An alarm consumer:
• Provides the Distributed Alarm system with a set of queries identifying alarmable items about which it wishes to receive notifications. A query remains active until changed or removed by the alarm consumer, and specifies an alarm provider or group of alarms—much like a SQL query with “wildcards.” Whenever an alarm provider issues notification of a change, the Distributed Alarm system checks the alarm for matches with all registered queries and passes updates to the corresponding alarm consumers.
• Upon receiving updates, shows or logs information relating to the status of the items or their transitions.
• Acknowledges alarms. The alarm consumer sends an acknowledgement notification to the Distributed Alarm system, identifying the alarm and the alarm provider. The notification is passed to the alarm provider, which then updates the status of the item to acknowledged (if appropriate) and in turn notifies the Distributed Alarm system, thereby ensuring that the update gets distributed to all interested alarm consumers.

Note: The majority of communication in the Distributed Alarm system consists of sending alarm queries and alarm records from one node to another. Within a node, alarm queries and alarm records are tracked and buffered by the internal alarm memory to minimize network traffic.
Distributed Alarm Group Lists

The Distributed Alarm system uses alarm groups to organize alarms into a local tree view. The distributed alarm display uses the tree view to filter alarms. You can view these alarm groups from multiple nodes on a network.

The Distributed Alarm system uses an alarm group list to combine alarm groups from local and remote nodes. An alarm group list is a named list consisting of InTouch nodes and the alarm groups defined on each of those nodes. It can also contain other alarm group list names and local alarm groups. An alarm consumer, such as the Alarm Viewer control, uses this list to query for alarms.

Under a query alias, the Alarm Viewer control can show the combined alarms from the groups that belong to the list. Alarms can be acknowledged on the local InTouch node or from a remote node on the network.

The following figure shows an alarm group list that combines alarm groups from three nodes. The alarm group list is defined locally on NodeC. The remaining alarm groups are from remote nodes.

![Alarm Group List Diagram]

The Distributed Alarm Display shows the alarms resulting from a query across all of the alarm groups that belong to the list. For example, if you were interested in showing all tank farm alarms across several InTouch nodes, you can create a list called TankFarmAlarms. To this list, you add alarm groups from all nodes that run tank farm InTouch applications.

For more information on creating alarm groups, see "Creating an Alarm Group" on page 23.

Summary Alarms versus Historical Alarms

Summary alarms are alarms that are currently active. Historical alarms are alarms that are not currently active and are typically stored to the alarm database.

For example, you might want to see a summary of all current alarms that are awaiting acknowledgment, whereas all other alarm information is of historical interest and of less urgency.

Alarm Disablement, Inhibition, and Suppression

You can turn alarms "off" or ignore them without actually removing the alarm configuration. You can either disable an alarm, inhibit it, or suppress it.

Alarm disablement and inhibition is controlled at the alarm provider. Suppression is controlled at the alarm consumer. For more information on providers and consumers, see Alarm Providers and Consumers on page 24.
• **Disablement.** You disable an alarm at the alarm provider by setting a flag that marks it as disabled. No matter what alarm conditions occur, the item is never put into an alarmed state. For information on dotfields you can use to disable an alarm, see *Enabling and Disabling Alarms for a Tag or Alarm Group* on page 111. You can disable or enable all of a tag’s alarms at one time. Also, for an alarm that has sub-states, you can disable each sub-state individually.

• **Inhibition.** You inhibit an alarm by:
  a. Adding an "inhibitor" tag to the alarm configuration in WindowMaker. The inhibitor tag is used at run time to mark the alarm as inhibited.
  b. Setting the inhibitor tag to True or False at run time. When the inhibitor tag is False, the alarm is handled normally. When the inhibitor tag is True, the item cannot alarm.

Each alarm sub-state can be inhibited by a different tag, and you can leave some sub-states with no inhibitor tag assigned.

Assigning a tag as an inhibitor tag for an alarm increases its cross-reference use count.

• **Suppression.** Suppression causes an alarm consumer to ignore certain alarms. If an alarm matches the exclusion criteria, it is not visible. That is, it is not shown on a display, printed, or logged at that particular alarm consumer.

  The actual alarm generation is completely unaffected by suppression. Alarm records can still be logged into alarm history.

If an alarm becomes disabled or actively inhibited while the item is in an alarmed state, the item is forced to a different (valid) state. What that state should be depends upon which states are available and whether they have also been disabled. This activity is handled by the alarm provider according to the type of alarm, limit values, and so on.

An alarm that is disabled or actively inhibited is not waiting for an acknowledgment. If the alarm has sub-states, it can only be waiting for an acknowledgment on sub-states that are still available.

---

**Terminal Services Alarm Support**

By using the Distributed Alarm system with Terminal Services for InTouch, alarm clients running on different terminal sessions can select what alarm data to show and how to present it.

Alarm Providers identify themselves by a name that uniquely identifies their application, and the instance of their application. This information is made available to the Distributed Alarm system when the Alarm Provider or the Alarm Consumer registers with the Distributed Alarm system.

The node on which an Alarm Provider is running is identified by a name that uniquely identifies the computer node in the system. The alarm records that are generated by Terminal Services Edition (TSE) client sessions include an expanded node name in the format Node:IP Address; for example, serverAlarm:192.168.1.23. This information is made available to the Distributed Alarm system when an instance of it starts up on the computer node.

When an alarm event is logged, the node and complete Alarm Provider name identify the source of the alarm.

When an alarm is acknowledged in a Terminal Services environment, the Operator Node that gets recorded will be the name of the client machine that the respective operator established the Terminal Services session from. If the node name can’t be retrieved, the node’s IP address will be used instead.

A terminal server client session cannot be an InTouch alarm provider.

---

**Distributed Alarm System Data Storage**

There are several forms of data storage used in the Distributed Alarm system:
• **Internal alarm memory (buffer)**
  Most information about current and recent alarms is held in memory on various computer nodes. InTouch uses two memory locations: one for summary alarms (current) and one for historical alarms and events. This model is also used in the Distributed Alarm system.

  The memory for summary alarms grows as needed to accommodate all current alarms up to the limit of available memory. The memory for historical alarms can grow only to a pre-determined limit. After the historical memory reaches this limit, the oldest alarm records are discarded as new ones are added. In a multi-node environment, the alarm memory on the various nodes constitute a single collective of alarm memory.

  For information about setting the limit, see "Configuring the Alarm Buffer Size" on page 36.

• **Alarm database**
  The Alarm DB Logger creates a database, keeping track of when an alarm occurs, makes a sub-state transition, is acknowledged, and when it returns to normal. Essentially, these records constitute a history of alarms in the system.

  Because it is based on the use of queries, the Distributed Alarm system supports using one computer node to log alarms for several other nodes.
InTouch HMI Alarms and Events Guide

CHAPTER 2

Configuring Alarms

In This Chapter

About Configuring Alarms .................................................................................................................. 29
Defining Alarm Hierarchies ............................................................................................................ 29
Configuring Tags with Alarm Conditions ...................................................................................... 31
Setting Event Properties for Individual Tags .................................................................................. 36
Configuring Global Settings for Alarms and Events ...................................................................... 37
Creating an Alarm Group List File .................................................................................................. 39

About Configuring Alarms

To configure alarms, you simply configure tags with alarm conditions.
If required, you can also:
• Define alarm hierarchies.
• Disable and inhibit alarms.
• Configure alarm comments.
• Configure miscellaneous alarm and event properties.

Defining Alarm Hierarchies

Each InTouch alarm belongs to an alarm group. Organizing related alarms into groups makes it easier for an operator to filter, show, and acknowledge alarms. For more information, see "Alarm Groups" on page 21.

The Distributed Alarm system uses alarm groups as the basis for its alarm group lists. For more information about creating Distributed Alarm system group lists, see Creating an Alarm Group List File on page 39.

Creating an Alarm Group

Before you start creating alarm groups, have a plan for how your alarm groups should be organized and what you want the alarm group names to be. Using a consistent group naming convention enforces a logical ordering of groups within the hierarchy.

In the following figure, notice the similarity of names assigned to groups at the same level within the hierarchy.
Also, notice that subordinate group names reference their parent groups by including a portion of the parent name. For example, the third-level alarm group name F1Tk1Lvl references its alarm group parent TnkFrm1 by including the F1 prefix in its group name. Develop a naming convention that suggests the parent-child relationship between alarm groups at different levels within the hierarchy.

Note: While alarm groups do not count as tags for InTouch licensing, they do count as tags in the database. Therefore, the total number of alarm groups plus actual tags cannot exceed the maximum limit set by your InTouch license.

An alarm group name must meet the following requirements:

- A name must be 32 characters or fewer.
- A name must begin with an alphanumeric character (A-Z, a-z, or 0-9).
- A name can contain the following keyboard characters (@, #, $, %, &,-, _, ?, !, \) beginning at the second character position within the name.
- If a name contains a hyphen (-), the name must begin with an alphabetic character.
- A name cannot contain a blank space.
- A name must have at least one alphabetic character.

To create an alarm group

2. Click Add. The Add Alarm Group dialog box appears.
3. In the Group Name box, type a name for the new alarm group.
4. To reassign the alarm group to another parent group:
   a. Click Parent Group to show the Alarm Groups dialog box. If this is the first alarm group defined for the InTouch application, the group is automatically assigned to the parent $System group.
   b. Select a new parent group from the list and click Close.
5. In the Comment box, type an optional comment up to 49 characters for the new alarm group and click OK.
   The Alarm Groups dialog box appears and shows the new alarm group added to the list.
6. Click Close.
Modifying an Alarm Group

You can modify an alarm group to:

- Rename it.
- Change the associated comment.
- Reassign it to another group.

To modify an alarm group

2. Select the alarm group to modify and click Modify. The Modify Alarm Group dialog box appears.
3. Make any changes to the alarm group’s name or comment.
4. To reassign the alarm group to another parent group:
   a. Click Parent Group to show the Alarm Groups dialog box.
   b. Select a new parent group from the list and click Close.
5. Click OK.

Deleting an Alarm Group

You can delete an alarm group and remove the group from the hierarchy. Alarms and tags that belong to deleted alarm groups are automatically reassigned to the immediate parent group above the deleted group in the hierarchy. Also, child groups of the deleted group are reassigned to the immediate parent group above the deleted group.

To delete an alarm group

2. Select the alarm group and click Delete. When a message appears, click Yes.
3. Click Close.

Configuring Tags with Alarm Conditions

You can configure any tag for an alarm by specifying the type of alarm and one or more alarm thresholds. Whenever the value of a tag reaches a defined threshold, an alarm occurs. Any transitions of a tag’s value in and out of an alarm state are reported to the Distributed Alarm system.

Configuring Discrete Alarms

A discrete alarm corresponds to a discrete tag. You can configure whether the alarmed state corresponds to the discrete tag’s true (On, Yes, 1) state or false (Off, No, 0) state.

To define alarm conditions for a discrete tag

1. Open the Tagname Dictionary.
2. Select an existing discrete tag or create a new discrete tag.
Configuring Alarms

InTouch HMI Alarms and Events Guide

3. Click either Alarms or Details & Alarms at the top of the Tagname Dictionary dialog box to show the discrete alarm details dialog box.

<table>
<thead>
<tr>
<th>ACK Model</th>
<th>Alarm Comment</th>
<th>Alarm State</th>
<th>Priority</th>
<th>Alarm Inhibitor</th>
</tr>
</thead>
<tbody>
<tr>
<td>Condition</td>
<td></td>
<td>On</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Event Oriented</td>
<td></td>
<td>Off</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Expanded Summary</td>
<td></td>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

4. In the ACK Model area, select the alarm acknowledgement model for the tag.
   - Click Condition for acknowledgment to count against all transitions into the alarmed state or a sub-state up to the time of the acknowledgement. This is the default acknowledgement model.
   - Click Event Oriented for an acknowledgment to only be for a particular transition to the alarmed state or a sub-state; an acknowledgment is accepted only if it refers to the most recent transaction.
   - Click Expanded Summary for an acknowledgment to only be for a particular transition, whether to an alarmed state, to a sub-state, or a return to normal. Each transition from the normal state marks the beginning of a new "return to normal" (RTN) group. All transitions in an RTN group must be acknowledged individually before the overall RTN group is considered acknowledged.

5. In the Alarm Comment box, type an alarm comment up to 131 characters.

   Note: The Alarm Comment box should not contain the double-quote character ("), A process that uses the double-quote as a delimiter will fail if it is fetching an alarm comment that includes a double-quote.

6. In the Alarm State area, select the active alarm state to be the discrete tag’s On or Off value.

7. In the Priority box, assign an alarm priority number between 1 to 999. The default priority number is 1, which is the highest alarm priority.

8. Optionally assign an alarm inhibitor tag for the discrete alarm.
   - In the Alarm Inhibitor box, click the button to show the Select Tag dialog box containing a list of defined tags.
   - Select a tag from the list and click OK. The name of the tag you selected as the inhibitor tag appears in the Alarm Inhibitor box.

   For more information on inhibiting alarms, see Inhibiting Alarms on page 35.

9. Click Save.

10. Click Close to close the Tagname Dictionary dialog box.

Configuring Value Alarms

A value alarm is associated with integer or real tags. You can set alarms when the tag value transitions from a set of predetermined thresholds that range from LoLo to HiHi. You can configure whether the alarmed state corresponds to any value of the tag and the associated priority of that alarm.

To configure a value alarm
1. Open the Tagname Dictionary.
2. Select an existing real or integer tag or create a new tag.
3. Click either Alarms or Details & Alarms at the top of the Tagname Dictionary dialog box to show the alarm details dialog box.

<table>
<thead>
<tr>
<th>ACK Model</th>
<th>Alarm Comment</th>
<th>Alarm Value Priority</th>
<th>Alarm Inhibitor</th>
<th>Reactor Level</th>
</tr>
</thead>
<tbody>
<tr>
<td>Condition</td>
<td></td>
<td>LoLo: 0</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Event Oriented</td>
<td></td>
<td>High: 1000</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Expanded Summary</td>
<td></td>
<td>Low: 200</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>HiHi: 150</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
4. In the **ACK Model** area, select the alarm acknowledgement model for the tag.
   - Click **Condition** for acknowledgment to count against all transitions into the alarmed state or a sub-state up to the time of the acknowledgement. This is the default acknowledgement model.
   - Click **Event Oriented** for an acknowledgment to only be for a particular transition to the alarmed state or a sub-state. An acknowledgment is accepted only if it refers to the most recent transaction.
   - Click **Expanded Summary** for acknowledgment to only be for a particular transition, whether to an alarmed state, to a sub-state, or a return to normal. Each transition from the normal state marks the beginning of a new "return to normal" (RTN) group. All transitions in an RTN group must be acknowledged individually before the overall RTN group is considered acknowledged.

5. In the **Alarm Comment** box, type a default comment up to 131 characters. The comment is assigned to the tag's .AlarmComment dotfield.

   **Note:** The Alarm Comment box should not contain the double-quote character ("'). A process that uses the double-quote as a delimiter will fail if it is fetching an alarm comment that includes a double-quote.

6. Select the alarm types (LoLo, Low, High, HiHi) to detect when the value of the tag is beyond an absolute limit.

7. In the **Alarm Value** boxes, type the limit values for the alarm types.

   For example, in the case of LoLo and Low alarms, an alarm condition exists whenever the value of the tag is less than the **Alarm Value**. In the case of High and HiHi alarms, an alarm occurs whenever the value of the tag exceeds the **Alarm Value**. You can use real numbers for the limits.

8. In the **Value Deadband** box, type the number of engineering units the tag value must drop below or above the alarm value before it transitions out of an alarm state.

   For example, to return-to-normal from an alarm condition, a tag value must not only return inside its alarm limit, but also return through your specified Value Deadband. The Value Deadband prevents nuisance alarms caused by repetitive re-annunciation of an alarm where the tag value hovers around the limit, continually fluctuating in and out of an alarm state.

9. Optionally assign an alarm inhibitor tag for the tag's alarm types (LoLo, Low, High, HiHi).
   - a. In the **Alarm Inhibitor** area, click the button to show the **Select Tag** dialog box containing a list of defined tags.
   - b. Select a tag from the list and click **OK**. The name of the tag you selected as the inhibitor tag appears in the **Alarm Inhibitor** box.

   For more information on inhibitor tags, see *Inhibiting Alarms* on page 35.

10. Click **Save**.

11. Click **Close** to exit the **Tagname Dictionary** dialog box.

### Configuring Deviation Alarms

A deviation alarm is associated with integer or real tags. You can set an alarm by comparing the current tag value to a target value, and then the absolute value of the difference is compared to one or more limits, expressed as a percentage of the range of the tag value.

For example, the following values set the conditions for a tag's minor and major deviation alarms:

- **Minimum Value** = -1000
- **Maximum Value** = 1000
- **Minor Deviation %** = 10
- **Major Deviation %** = 15
Target Value = 500

Using these values as an example, the minor and major deviation alarms points are calculated by the following steps:

1. Calculate the total value range of the tag.
   \[1000 - (-1000) = 2000\]

2. Multiply the total value range of the tag by minor and major deviation percentages.
   \[2000 \times 0.10 = 200 = \text{minor deviation limit}\]
   \[2000 \times 0.15 = 300 = \text{major deviation limit}\]

3. Add and subtract the minor and major deviation limits from the target value.
   \[500 - 200 = 300 = \text{minor deviation lower limit}\]
   \[500 + 200 = 700 = \text{minor deviation upper limit}\]
   \[500 - 300 = 200 = \text{major deviation lower limit}\]
   \[500 + 300 = 800 = \text{major deviation upper limit}\]

**To configure a deviation alarm**

1. Open the Tagname Dictionary.
2. Select an existing real or integer tag or create a new tag.
3. Click either **Alarms** or **Details & Alarms** at the top of the Tagname Dictionary dialog box to show the alarm details dialog box.

4. Select the deviation (Minor and Major Deviation) alarm types you want to use to detect when the value of an analog type tag is in a major or minor deviation from the specified target value.

5. In the %Deviation box, type the percentage that the analog tag can deviate from the target value to trigger a minor or major deviation alarm condition. It is expressed as a percentage of the range of the tag. For an I/O tag, the Min EU and Max EU values entered in the tag's details dialog box define the range. For memory tags, the range is defined by the minimum value and maximum value.

6. In the Target box, type the tag reference value that minor and major deviation percentages are based.

7. In the Deviation Deadband % box, type the deviation percentage the tag value must drop below the limit before the tag is taken out of its alarm condition.

8. Click Save.
9. Click Close to close the Tagname Dictionary dialog box.

**Configuring Rate of Change Alarms**

A rate of change alarm detects when the absolute value of an alarm exceeds a specified limit over a measured interval. A tag is tested for a rate-of-change alarm whenever its value changes. The change rate is calculated using the previous tag value, the time of the previous change, the current tag value, and the current time.

The calculated rate of change over time is compared to a rate-of-change percentage limit specified for a tag. If the calculated rate-of-change is greater than the percentage limit, an alarm condition is set for the tag. A rate-of-change alarm remains active until the rate at which the tag is changing is less than the alarm limit.
To configure a rate of change alarm

1. Open the Tagname Dictionary.
2. Select an existing real or integer tag or create a new tag.
3. Click either Alarms or Details & Alarms at the top of the Tagname Dictionary dialog box to show the alarm details dialog box. The following figure shows only those options that apply to rate-of-change alarms.

4. Select the Rate of Change box.
5. In the % per box, enter the maximum allowable percentage change limit.
6. Select Sec, Min, or Hr as the time interval unit.
7. In the Priority box, type a number between 1 and 999 to set the alarm priority.
8. Optionally assign an alarm inhibitor tag for the rate of change alarm.
   a. In the Alarm Inhibitor area, click the button to show the Select Tag dialog box containing a list of defined tags.
   b. Select a tag from the list and click OK. The name of the tag you selected as the inhibitor tag appears in the Alarm Inhibitor box.

For more information on inhibiting alarms, see Inhibiting Alarms on page 35.

9. Click Save.
10. Click Close to close the Tagname Dictionary dialog box.

Disabling Alarms

You can disable or enable all alarms of a tag at once using the .AlarmEnabled or AlarmDisabled dotfields. For an alarm that has sub-states, each sub-state can be individually disabled. For example, an analog value alarm can have Hi enabled and HiHi disabled.

During run time, the Alarm Provider does not generate alarms for an alarm or sub-state that is disabled. Changes to whether an alarm or sub-state is disabled can be made at run time.

Whenever an alarm transitions from disabled to enabled, the checking logic determines whether the item should be put in the alarmed state by the Alarm Provider.

If an alarm becomes disabled or actively inhibited while the item is in an alarmed state, the item will be forced to a different (valid) state. What that state should be depends upon which states are available and whether they have also been disabled. This activity is handled by the Alarm Provider according to the type of alarm and limit values.

Inhibiting Alarms

You can optionally assign to each alarm or alarm sub-state an inhibitor alarm tag that prevents the alarm from transitioning into an active state.

- When the inhibitor tag value becomes and remains TRUE (non-zero or non-NULL), the alarm is inhibited.
- Likewise, when the inhibitor alarm tag becomes and remains FALSE (zero or NULL), the alarm is not inhibited.

You can only change the inhibitor tag in WindowMaker. You can change the value of an inhibitor tag at run time.
You can assign inhibitor tags to individual alarm sub-states. Each sub-state can be inhibited by a different tag, and you can leave some sub-states with no inhibitor tag assigned.

An alarm that is inhibited (and for which the tag is TRUE) is not waiting for an acknowledgment. If the alarm has sub-states, it can only be waiting for an acknowledgment on sub-states that are still available.

An alarm or sub-state can be independently disabled, inhibited, or both. Only if the alarm is both enabled and not actively inhibited is the alarm capable of becoming active.

If an alarm or sub-state has no inhibitor tag assigned to it, the effect is the same as if it had an inhibitor tag that is always FALSE.

Whenever the transition causes an alarm to change from being actively inhibited, the checking logic determines whether InTouch should put the item in the alarmed state.

If an alarm becomes actively inhibited while the item is in an alarmed state, the item must be forced to a different (valid) state. What that state should be depends upon which states are available and whether they have also been disabled or actively inhibited. This activity is handled by InTouch according to the type of alarm, limit values, and so on.

If an alarm (or an alarm sub-state) becomes actively inhibited while waiting for an acknowledgment, the item must be forced to a different (valid) state. As with whether the item is alarmed, InTouch must determine what this state should be.

Alarm inhibitor tags are included in use counts and license limitations.

Use the following read-only tag dotfields to get the name of the alarm inhibitor tag:

- AlarmDscInhibitor
- AlarmLoLoInhibitor
- AlarmLoInhibitor
- AlarmHiHiInhibitor
- AlarmHiInhibitor
- AlarmMajDevInhibitor
- AlarmMinDevInhibitor
- AlarmRocInhibitor

These fields return the name of a tag. Therefore, you can use the name in an indirect tag reference in an InTouch QuickScript to find out the current value of the alarm inhibitor tag, or to change the value of the alarm inhibitor tag. By doing this, you can force groups of alarms to be enabled or actively inhibited during run time.

**Setting Event Properties for Individual Tags**

When you define a tag to do event monitoring, an event message is logged to the alarm system each time the tag's value changes. The event message logs how the value changed. For example, whether the operator, I/O, QuickScripts, or the system initiated the change.

1. Open the Tagname Dictionary.
2. Select an existing tag or create a new tag associated with data that will be recorded as an event.
3. Select Log Events. The Priority box becomes available. The value you enter for the Priority determines the event priority level for the tag.

4. In the Priority box, assign a number from 1 to 999 as the event priority. 1 is the highest event priority and 999 the lowest.

5. Click Save.

6. Click Close to close the Tagname Dictionary dialog box.

Configuring Global Settings for Alarms and Events

You can configure the following global settings that apply to all alarms and events generated by an application:

- Internal alarm memory (buffer) size.
- Whether an alarm’s return to normal implies acknowledgement. For more information, see Using Automatic Acknowledgement When the Tag Value Returns to Normal on page 89.
- Event logging.
- Whether alarm enabling is retentive when WindowViewer is restarted.
- Whether to use alarm acknowledgement comments as the general alarm comment. For more information, see Using Alarm and Acknowledgement Comments on page 90.

Configuring the Alarm Buffer Size

Communication in the Distributed Alarm system consists largely of alarm queries and alarm records sent between nodes. Within a node, alarm queries and records are held in the InTouch internal alarm memory, also called the alarm buffer, to minimize network traffic. The alarm buffer size is maximum number of alarms the node can store for summary or historical alarm queries. The alarm buffer deletes the oldest records to make room for new records.

Only alarm events stored in memory can be shown in an application window. If your InTouch application does not show any alarm status, you can set the buffer size to 1 to conserve node memory.

Assigning a large value to the alarm buffer can potentially affect node performance. For a Distributed Alarm system, we recommend the default value of 500.

To configure the alarm buffer size

1. Open the InTouch application in WindowMaker.
2. On the **Special** menu, point to **Configure**, and then click **Alarms**. The **Alarm Properties** dialog box appears.

3. In the **Alarm Buffer Size** box, type the maximum number of alarm entries that can be stored in the memory alarm buffer for summary or historical queries.

4. Click **OK**.

### Enabling Events

You can enable events to be logged within the application. An event represents a recognized change in application data resulting from an operator action, QuickScript, or I/O.

A tag's **Log Events** property must be set from the Tagname Dictionary before the tag's associated events are stored in the internal alarm memory or logged to the alarm database. For more information about specifying event logging for a tag, see **Setting Event Properties for Individual Tags** on page 36.

**To enable events**

1. Open the InTouch application in WindowMaker.

2. On the **Special** menu, point to **Configure**, and then click **Alarms**. The **Alarm Properties** dialog box appears.

3. Select the **Events Enabled** check box to log all events that occur while an InTouch application is running.

4. Click **OK**.

### Making Alarm Enabling Retentive

You can select to retain the current value assigned to a tag's **AlarmEnabled** dotfield when the InTouch application is stopped and then restarted.

The value assigned to the **AlarmEnabled** dotfield toggles alarm and event logging on or off. The **AlarmEnabled** dotfield can be assigned to tags or alarm groups. When the **AlarmEnabled** dotfield is assigned to an alarm group, it determines whether all alarms associated with the tags within the specified alarm group are logged or not.
To make alarm enabling retentive

1. Open the InTouch application in WindowMaker.

2. On the Special menu, point to Configure, and then click Alarms. The Alarm Properties dialog box appears.

3. Select the Alarm Enable Retentive check box to retain the current state of the .AlarmEnabled dotfield as the initial value when the InTouch application re-started.

4. Click OK.

Creating an Alarm Group List File

You use the Distributed Name Manager to create an alarm group list. Then, you add existing alarm groups from the local and remote nodes to the list.

The following table shows the syntax to specify alarm groups from the Distributed Name Manager.

<table>
<thead>
<tr>
<th>Node</th>
<th>Alarm Group Syntax</th>
</tr>
</thead>
<tbody>
<tr>
<td>Local</td>
<td>\InTouch\Group_Name</td>
</tr>
<tr>
<td></td>
<td>or .Group_Name</td>
</tr>
<tr>
<td>Remote</td>
<td>\Node_Name\InTouch\Group_Name</td>
</tr>
<tr>
<td></td>
<td>or Node_Name.Group_Name</td>
</tr>
</tbody>
</table>

For these examples, Node_Name is the name of the InTouch remote node. Group_Name is the name of the alarm group. If the alarm group is defined on the local node where the alarm group list is being defined, you can simply enter the alarm group name with a preceding period. For example, .Group_Name.
To create an alarm group list

1. On the Special menu, point to Configure, and then click Distributed Name Manager. The Distributed Name Manager dialog box appears.

2. In the Group Properties area, type the name of the alarm query in the Name box.

3. In the Members box, type the list of InTouch nodes and alarm groups to be included in the query.

   You can enter the node names and alarm group names using Standard Group Entry syntax or as short cut entries using periods. Short cut entries are converted to Standard Group Entries when you save the alarm group list.

   **Note:** The Node.Group and .Group syntax can be used only in this configuration dialog box. It is not valid in the alarm display configuration or any alarm QuickScript function.

4. Click Add to add the list to your alarm group file.

   The syntax of the members is automatically converted.

5. Click OK.

6. Add the name of the alarm group list to a query in an Alarm Viewer control. The Alarm Viewer control now shows alarms for all groups specified in the list.
About Alarm Queries

An alarm query retrieves either:

- Alarms and events (historical alarms) from the InTouch internal alarm memory or the alarm database.
- Current alarms (summary alarms) from the InTouch internal alarm memory.

When you configure an InTouch alarm ActiveX control, you specify the query source. You can also select query options to filter the query results.

The following figure shows the **Query** tab for the Alarm Viewer ActiveX control.

![Query Tab](image)

In this example, you create an alarm display that shows alarm data selected by the following criteria:

- Alarm priority (1-999)
- Alarm state (All, Acknowledged, or Unacknowledged)
- Query type (Summary or Historical)
- Alarm group (Local or remote data sources)

You can save your queries to an .xml file, called a "query favorites" file. During run time, you can update the alarm display with new alarm data by running another query using selection criteria saved to the file.
Other InTouch alarm ActiveX controls provide more extensive query criteria. The following figure shows the Query Filter tab of the Alarm DB Viewer control.

You build your queries by selecting alarm or event attributes from the list shown in the left pane of the dialog box. Then, you assign a value to the selected attributes. Finally, you can combine attributes using Boolean operators to set your query filter conditions.

You can write QuickScripts that include query functions or dotfields to select alarm and event records from alarm memory. The following Alarm Viewer control statement uses the ApplyQuery() method to query the alarm memory.

```
#AlarmViewerCtrl1.ApplyQuery ("\InTouch!$System",500,600,"All","Historical");
```

This statement retrieves all historical alarms specified by the "\InTouch!$System" query with a priority between 500 and 600. The selected alarm records appear in the Alarm Viewer control display.

**Example Alarm Queries**

Alarm queries follow this syntax for the local node:

```
\Provider!AlarmGroup
```

For example:

```
\InTouch!$System
```

Use the following query syntax for remote nodes:

```
\\NodeName\\Provider!AlarmGroup
```

For example, on a node called MyNode1:

```
\\MyNode1\\InTouch!$System
```

Use the following syntax for querying alarms from a Galaxy with the Register using "Galaxy_<Galaxy name>" instead of "Galaxy" check box selected. This syntax gets alarms from a specific alarm name of an object in a specific area on a specific computer. The alarm name may be an attribute name or an alarm primitive name. Galaxy names are displayed in the alarm window's Provider column.

```
\\NodeName\\Galaxy_GalaxyName!AreaName!ObjectName.AlarmName
```

The following syntax gets all alarms from a specific area:

```
\Galaxy_GalaxyName!AreaName
```

The following syntax gets alarms from two areas:

```
\Galaxy_GalaxyName!Area1 \Galaxy_GalaxyName!Area2
```

The following syntax gets all alarms in the specified Area from the Platform on the specified computer node (by default):
\NodeName\Galaxy_GalaxyName!AreaName

You can also use single wildcard to match alarm names within a specified area. The following syntax gets all alarms from all objects starting with the characters "Tank" in the "AreaName" area:
\Galaxy_GalaxyName!AreaName!Tank*

The following syntax gets all alarms named "Hi" from all objects in the "AreaName" area:
\Galaxy_GalaxyName!AreaName!.Hi

**Getting More InTouch Query Information**

The following table lists the references for more information about queries for each InTouch query source.

About Viewing Current Alarms

Use the InTouch Alarm Viewer ActiveX control to view alarms. The Alarm Viewer control has scroll bars, sizable columns, multiple alarm selections, an update status bar, dynamic display types, and show colors based on the type of alarm.

We recommend that you use the Alarm Viewer control to view InTouch alarms. However, you can continue to use the Distributed Alarm object to view alarms from applications created with versions of InTouch earlier than 7.1.

Configuring an Alarm Viewer Control

You can set Alarm Viewer control options from WindowMaker and options that users can modify while the Alarm Viewer control is running. You set these option in the AlarmViewerCtrl Properties dialog box.
Configuring the Appearance of the Grid

When you configure the visual appearance of the Alarm Viewer control, you can:

- Include a status bar.
- Include a column header.
- Include horizontal and vertical grid lines that show the rows and columns.
- Include a run-time option that enables the user to adjust the width of columns.
- Set the colors of visual elements.

The following figure shows how the Alarm Viewer control appears when all visual properties are active.

To configure the visual appearance

1. Right-click the Alarm Viewer control, and then click **Properties**. The AlarmViewerCtrl Properties dialog box appears.
2. Click the General tab.
3. Set the visual appearance. Configure any of the following.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Perform Query on Startup</strong></td>
<td>Automatically begins updating the control using default query properties. If a query is not run when the application starts, you need to run a script using the Requery() function to update the grid. The Requery option is also available on the grid's shortcut menu during run time.</td>
</tr>
<tr>
<td><strong>Show Context Sensitive Menu</strong></td>
<td>Enables a right-click shortcut menu during run time.</td>
</tr>
<tr>
<td>Option</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td><strong>Use Default Ack Comment</strong></td>
<td>Controls whether a default comment appears when an operator acknowledges an alarm. If this box is checked and a string is entered, the string is used during run time as the default comment. If this box is not selected, when the operator acknowledges an alarm, a dialog box appears to enter an optional comment. The dialog box can be filled in or left blank.</td>
</tr>
<tr>
<td><strong>Retain Suppression</strong></td>
<td>Retain alarm suppression between alarm queries when the alarm query is changed.</td>
</tr>
<tr>
<td><strong>Show Status Bar</strong></td>
<td>Toggles whether the status bar appears at the bottom of the Alarm Viewer control.</td>
</tr>
<tr>
<td><strong>Row Selection</strong></td>
<td>Enables users to select individual rows during run time. Each row represents an alarm record. Users can select multiple alarms.</td>
</tr>
<tr>
<td><strong>Silent Mode</strong></td>
<td>If Silent Mode is selected, the Alarm Viewer control does not show error messages during run time. If it is not selected, the alarm display shows pop up error messages. In either case, error messages are always sent to the ArchestrA Log Viewer.</td>
</tr>
<tr>
<td><strong>Show Message</strong></td>
<td>Shows the message typed in the text box. This is the message shown when there are no alarms.</td>
</tr>
<tr>
<td><strong>Show Heading</strong></td>
<td>Toggles whether the heading bar appears at the top of the Alarm Viewer control.</td>
</tr>
<tr>
<td><strong>Use Extended Selection</strong></td>
<td>Enables the user to select multiple alarms simultaneously by holding down <code>CTRL</code> or <code>SHIFT</code> keys in conjunction with the mouse button. Available only if Row Selection check box is selected.</td>
</tr>
<tr>
<td><strong>Flash Unack Alarms</strong></td>
<td>Enables unacknowledged alarms to flash once per second until they are acknowledged. Freezing the alarm display in WindowViewer does not stop unacknowledged alarms from flashing.</td>
</tr>
<tr>
<td><strong>Resize Columns</strong></td>
<td>If Resize Columns is selected, the user can resize the width of the columns during run time. Otherwise, column width is static and can be set only from WindowMaker.</td>
</tr>
<tr>
<td><strong>Show Grid</strong></td>
<td>If Show Grid is selected, the Alarm Viewer control shows horizontal and vertical lines that separate the rows and columns of the alarm display. If it is not selected, no grid is visible.</td>
</tr>
</tbody>
</table>

4. Click Apply.
5. Click the **Color** tab.

6. Click the palette button to assign colors to the visual elements of the Alarm Viewer control.

7. Click **Apply** to save your color selections.

8. Click **OK**.

### Configuring the Font Display

You can configure how the text appears for the Alarm Viewer control.

**To configure the font properties**

1. Right-click the Alarm Viewer control, and then click **Properties**. The **AlarmViewerCtrl Properties** dialog box appears.

2. Click the **General** tab.

3. Click **Font**. The standard Windows **Font** dialog box appears. Configure the font and then click **OK**.

4. Click **OK**.

### Configuring Display Column Details

For the Alarm Viewer control, you can:

- Select and order the columns.
- Set the width of a column in pixels.
- Rename a column.
To configure the display column details

1. Right-click the Alarm Viewer control and then click Properties. The AlarmViewerCtrl Properties dialog box appears.
2. Click the General tab.
3. Click Column Details. The Column Details dialog box appears.
4. In the Name column, select the check boxes next to the names of the columns that you want to appear. You must select at least one column from the list.

<table>
<thead>
<tr>
<th>Column</th>

Viewing Current Alarms

<table>
<thead>
<tr>
<th>Tag Comment</th>
<th>The comment for the tag.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Alarm Comment</td>
<td>The comment associated with the tag's alarm. This comment was typed in the Alarm Comment box when the tag's alarm was defined. When an acknowledgement comment is introduced for alarms, the new comment is updated in this comment column.</td>
</tr>
</tbody>
</table>

| User 1 | The numerical value of the AlarmUserDefNum1 property of the alarm. |
| User 2 | The numerical value of the AlarmUserDefNum2 property of the alarm. |
| User 3 | The string value of the AlarmUserDefStr property of the alarm. |

5. Rearrange columns by selecting the column name and using the up and down arrows. The column name appearing at the top of the Column Details dialog box is the left-most column of the alarm control.

6. To change the name of a column or its width, select the column and click Edit. The Edit dialog box appears.

   ![Edit dialog box](image)

   a. In the New Name box, type the new column name.
   b. In the New Width box, type the column width. The column width can range from 1 to 999 pixels.
   c. Click OK.

7. Click OK in the Column Details dialog box.
8. Click Apply.

**Controlling Access to Features at Run Time**

If you right-click on the Alarm Viewer control during run time, a context-sensitive (shortcut) menu appears.

You can control which menu commands are shown in the shortcut menu.

**To configure the shortcut menu**

1. Right-click the Alarm Viewer control, and then click Properties. The AlarmViewerCtrl Properties dialog box appears.
2. Click the General tab.
3. Select the Show Context Sensitive Menu check box.
4. Click Configure Context Menus.

The Context Sensitive Menus dialog box appears.

![Context Sensitive Menus dialog box]

This dialog box shows a hierarchical list of commands that can appear in an Alarm Viewer control shortcut menu.

5. Configure the shortcut menu options. You must select at least one shortcut menu command.

<table>
<thead>
<tr>
<th>This command</th>
<th>Allows the run-time user to</th>
</tr>
</thead>
<tbody>
<tr>
<td>Ack Selected</td>
<td>Acknowledge selected alarms. If Ack Selected and Ack Others menu items are both unchecked, the Use Default Ack Comment check box and the text box are disabled.</td>
</tr>
<tr>
<td>Ack Others</td>
<td>Acknowledge alarms by other methods. The user can select which alarms to acknowledge. If Ack Others is selected, you must select at least one of the submenu items.</td>
</tr>
<tr>
<td>Ack All</td>
<td>Acknowledge all active alarms.</td>
</tr>
<tr>
<td>Ack Visible</td>
<td>Acknowledge visible alarms.</td>
</tr>
<tr>
<td>Ack Selected Groups</td>
<td>Acknowledge all alarms with the same group name as the selected group(s) and with the same provider name.</td>
</tr>
<tr>
<td>Ack Selected Tags</td>
<td>Acknowledge all alarms with the same group name as the selected tag(s) and with the same provider, group, and priority.</td>
</tr>
<tr>

<td>Suppress selected alarms.</td>
</tr>
<tr>
<td>Suppress Others</td>
<td>Suppress alarms by other methods shown in the shortcut menu.</td>
</tr>
<tr>
<td>Suppress All</td>
<td>Suppress all alarms.</td>
</tr>
<tr>
<td>Suppress Visible</td>
<td>Suppress all visible alarms.</td>
</tr>
<tr>
<td>Suppress Selected Groups</td>
<td>Suppress all alarms with the same group name as the selected group(s).</td>
</tr>
<tr>
<td>Suppress Selected Tags</td>
<td>Suppress all alarms with the same tagname as the selected tag(s).</td>
</tr>
<tr>
<td>Suppress Selected Priorities</td>
<td>Suppress all alarms with the same priority as the selected priority or priorities.</td>
</tr>
<tr>
<td>Uns suppress All</td>
<td>Uns suppress all suppressed alarms.</td>
</tr>
</tbody>
</table>
Query Favorites
Open the Alarm Query dialog box.

Stats
Open the Alarm Statistics dialog box.

Suppression
Open the Alarm Suppression dialog box.

Freeze
Toggle the freeze/unfreeze mode of the Alarm Viewer control.

Requery
Re-run the alarm query.

Sort
Open the Sort dialog box.

6. Click **OK**.

7. Click **Row Selection** to enable users to select a row from the Alarm Viewer control during run time.

8. Click **Use Extended Selection** to enable users to select multiple alarm records simultaneously from the Alarm Viewer control using the **SHIFT** or **CTRL** keys.

9. Click **Apply**.

**Selecting the Alarms to Display**

The Alarm Viewer control can show summaries of active alarms or listings of historical alarms.

**To set general alarm query properties**

1. Right-click the Alarm Viewer control and then click **Properties**. The AlarmViewerCtrl Properties dialog box appears.

2. Click the **General** tab.

3. Select the **Perform Query on Startup** check box to automatically update the Alarm Viewer control using default query properties when the application starts.

4. Select the **Show Message** check box to show a default message when there are no alarms. In the text box, type the message to show.

5. Click **Apply**.

**To configure the query default**

1. Right-click the Alarm Viewer control and then click **Properties**. The AlarmViewerCtrl Properties dialog box appears.

2. Click the **Query** tab.

3. In the **From Priority** box, type the minimum alarm priority value (1 to 999).

4. In the **To Priority** box, type the maximum alarm priority value (1 to 999).
5. Click the **Query Type** arrow and select either **Historical or Summary** as the default run-time alarm display.

   The default type of display can be changed during run time by running a QuickScript containing a query function. For example, if the script includes the ApplyQuery() method with its Type parameter set to "Summary," then the grid shows a summary of current alarms. Conversely, if the same grid has an ApplyQuery() method run against it with the Type parameter set to "Historical", it shows historical alarms. The QueryType property reflects the current state of the alarm display.

6. In the **Alarm Query** box, type a valid alarm query. For example, type `\InTouch\$System` to query for all alarms that belong to the default $System alarm group.

7. Click OK.

**Using Query Favorites to Create Custom Saved Queries**

You can configure a list of query favorites for operators to select from a shortcut menu.

If WindowViewer is running on Windows Vista or newer operating systems, make sure that you put the query favorites file in a folder that is accessible to Windows Vista or newer standard users. If WindowViewer always runs with the same user account, you can use:

```
C:\Users\<username>\AppData\Local\...
```

If different users will run WindowViewer, you can use:

```
C:\Users\Public\Documents\...
```

**To configure the query favorites file**

1. Right-click the Alarm Viewer control and then click **Properties**. The **AlarmViewerCtrl Properties** dialog box appears.

2. Click the **Query** tab.

3. Configure the query favorites file.
   
   a. In the **Query Favorites File** box, type the network path and file name or click the ellipse button to browse for the file.
   
   b. To edit the Filter Favorites file, click the **Edit Query Favorites** button. The **Alarm Query** window opens, allowing you to add, modify, or delete filters from your favorites file. When you are done, click **OK** to save your changes and close the window.

4. Click **OK**.

**Using Colors for Various Types of Alarm Records**

You can set color options for different alarm states that appear in the Alarm Viewer control.
To configure the alarm display colors

1. Right-click the Alarm Viewer control and then click Properties. The AlarmViewerCtrl Properties dialog box appears.

2. Click the Color tab.

3. Click each color box to open the color palette. Click the color that you want to use in the palette for each of the following:

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Window</td>
<td>Sets display background color.</td>
</tr>
<tr>
<td>Title Bar Text</td>
<td>Sets title bar text color (available only if Show Heading option is selected).</td>
</tr>
<tr>
<td>Alarm Return</td>
<td>Sets color of returned alarms (alarms that have returned to normal without being acknowledged).</td>
</tr>
<tr>
<td>Grid</td>
<td>Sets color of the grid. By default the grid is not shown. The default grid color is light gray. The color of the grid in the alarm object is automatically set to a contrasting color of the selected Window color.</td>
</tr>
<tr>
<td>Title Bar Background</td>
<td>Sets title bar background color (available only if the Show Heading option is selected).</td>
</tr>
<tr>
<td>Event</td>
<td>Sets color of events.</td>
</tr>
</tbody>
</table>

4. In the Alarm Priority boxes, type alarm priority numbers that serve as breakpoints for the different colors used to identify unacknowledged alarms, acknowledged alarms, and flashing unacknowledged alarms.

5. Click the UnAck Alarm and Ack Alarm color boxes to open the color palette. Click the color in the palette that you want to use.

6. To configure the alarm query to flash unacknowledged alarms, click the General tab, select the Flash Unack Alarms check box, then click the Color tab and select the Flash Unack Alarms color boxes. Select the color that you want to use for each alarm priority range.

**Note:** The Alarm Viewer control cannot show changes that occur in less than a second. If an alarm changes state twice within a second, the Alarm Viewer control does not recognize the change.

7. Click Apply.
Configuring the Shown Time Format of Alarm Records

You can configure the time format for shown alarm records.

For the Alarm Viewer control, the original alarm time is the date/time stamp of the onset of the alarm. If tag is an I/O tag, then it is the time stamp from the I/O Server if that server is capable of passing time stamps.

To configure the time format

1. Right-click the Alarm Viewer control and then click Properties. The AlarmViewerCtrl Properties dialog box appears.
2. Click the Time Format tab.
3. In the Time Format list, click the desired time format. The Time Format box shows a set of strings consisting of characters separated by the % symbol for the format you selected.

<table>
<thead>
<tr>
<th>String character</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>d</td>
<td>Two-digit day of the month.</td>
</tr>
<tr>
<td>b</td>
<td>Three-letter month abbreviation.</td>
</tr>
<tr>
<td>Y</td>
<td>Four-digit year.</td>
</tr>
<tr>
<td>m</td>
<td>Two-digit month.</td>
</tr>
<tr>
<td>y</td>
<td>Two-digit year.</td>
</tr>
<tr>
<td>#x</td>
<td>Full day and date. For example: Friday, August 10, 2007</td>
</tr>
<tr>
<td>B</td>
<td>Complete month name.</td>
</tr>
<tr>
<td>H</td>
<td>Hours in 24 hour time format.</td>
</tr>
<tr>
<td>M</td>
<td>Minute.</td>
</tr>
<tr>
<td>p</td>
<td>AM or PM (for 12 hour time format).</td>
</tr>
</tbody>
</table>
### Viewing Current Alarms

**String character** | **Description**
---|---
S | Seconds.
s | Fractions of a second.
I | Hours in 12 hour time format.

4. In the Displayed Time list, select the shown time:

**OAT** | The original alarm time, which is the date/time stamp of the onset of the alarm.

**LCT** | The last changed time, which is the date/time stamp of the most recent change of state for the instance of the alarm: onset of the alarm, change of sub-state, return to normal, or acknowledgment.

**LCT But OAT on ACK** | The last changed time, but the original alarm time on acknowledge. The last changed time is used while the alarm is unacknowledged, then the original alarm time is used after the alarm has been acknowledged.

5. In the Displayed Time Zone list, select the time zone:

**GMT** | Greenwich Mean Time, also known as Coordinated Universal Time, UTC, or Zulu.

**Local Time** | Alarm time adjusted for the local time zone.

**Origin Time** | Alarm time adjusted for the time zone of the alarm source.

6. Click **Apply**.

### Configuring the Sort Order of Alarm Records

You can sort the alarm records in the list. By default, the Alarm Viewer control lists alarm records by time in ascending order.

You can sort alarm records in ascending or descending order based on a primary column and an optional secondary sort column.

**To configure the sort order of alarm records**

1. Right-click the Alarm Viewer control, and then click Properties. The AlarmViewerCtrl Properties dialog box appears.
2. Click the Query tab.

3. Select sorting options by completing the following:
   a. Select the primary sort column from the Sort Column list. Only visible columns appear in the Sort Column list. If you do not see the column you want, go to the General tab and select the column from Column Details.
   b. Select the secondary sort column from the Secondary Sort Column list.
   c. If you selected Time as the primary sort column, the Auto Scroll to New Alarms check box becomes available. Select this option if you want to automatically scroll and show new alarms as they occur.
   d. Select Ascending or Descending as the sort direction.
4. Click Apply.

Using an Alarm Viewer Control at Run Time

The Alarm Viewer control includes a shortcut menu that provides operators quick access to commands that can be applied to the display object of one or more selected alarms, alarm groups, tags, and priorities.

The following lists shows the commands available from the Alarm Viewer control shortcut menu:

- **Ack Selected** - Acknowledges the selected alarm(s).
- **Ack Others** - A sub-menu appears that lists other acknowledgement commands.
  - Ack All - Acknowledges all the alarms in the current alarm query. Because the alarm grid has only a limited display area, the Ack All command may acknowledge alarms that are not visible in the grid.
  - Ack Visible - Acknowledges only those alarms that are currently visible in the alarm grid.
  - Ack Selected Groups - Acknowledges all alarms that have the same group name from the same provider as one or more of the selected alarms.
  - Ack Selected Tags - Acknowledges all alarms that have the same tag from the same provider and group name and having the same priority as one or more of the selected alarms.
  - Ack Selected Priorities - Acknowledges all alarms that have the same priority from the same provider and group name as one or more of the selected alarms.
- **Suppress Selected** - The selected alarm(s) is/are suppressed.
- **Suppress Others** - A sub-menu opens that contains suppression commands.
  - Suppress All - Suppress showing current and future occurrences of all alarms.
  - Suppress Visible - Suppress showing current and future occurrences of any visible alarm.
o Suppress Selected Groups - Suppress showing current and future occurrences of any alarm that belongs to the same groups of one or more selected alarms having the same Provider name.

o Suppress Selected Tags - Suppress showing current and future occurrences of any alarm that belongs to the same tag name of one or more selected alarms having the same Provider name, Group name and Priority range.

o Suppress Selected Priorities - Suppress showing current and future occurrences of any alarm that belongs to the same priorities of one or more selected alarms having the same Provider name and Group name.

o Unsuppress All - Clears the suppression settings.

- Query Favorites - Shows the Alarm Query dialog box to select a previously saved alarm query. You can also add, modify and delete alarm queries.

- Stats - Shows the Alarm Statistics dialog box.

- Suppression - Shows the Alarm Suppression dialog box.

- Freeze - Freezes the current display.

- Requery - Queries the alarm provider again.

- Sort - Shows the Secondary Sort dialog box.

Viewing Status Bar Information

If you select the Show Status Bar option from the General properties page, a status bar appears at the bottom of an Alarm Viewer control during run time.

| Status | Displaying 1 to 12 of 451 alarms | Default Query | 100% Complete |

The status bar contains three indicators: A status message, current alarm query, and a progress bar. These indicators provide an overview of the current state of the display query and provide details about the suppression available in the Alarm Viewer control. The right pane of the status bar is red when the control is frozen and the left pane of the status bar is red when one or more alarms are suppressed. The word "suppression" is shown in the left pane when suppression is in effect.

Using Query Favorites at Run Time

Use the Query Favorites command on the Alarm Viewer control’s shortcut menu to quickly select an alarm query from a list of previously defined alarm queries. You can also create new named queries, edit an existing query, or delete an existing query.

Changes to an alarm query are not automatically applied to other Alarm Viewer controls using the same query. Deleting an alarm query does not automatically remove the query from other Alarm Viewer controls using the same query.

Note: For multi-line alarm queries appearing in the Alarm Viewer control, line separations appear as "garbage" characters. This does not affect the function.
**To select an alarm query at run time**

1. Right-click the Alarm Viewer control and then click Query Favorites. The Alarm Query dialog box appears.

2. Select the named query that you want to show in the list of currently defined queries.
3. Click OK. The Alarm Viewer control now shows alarm information retrieved by the query.

**To add a new named query at run time**

1. Right-click the Alarm Viewer control and then click Query Favorites. The Alarm Query dialog box appears.
2. Click Add. The Add Query dialog box appears.
3. Configure the query. Do the following:
   a. In the Name box, type the name that you want to use to identify the query.
   b. In the Query box, type the sets of InTouch alarm queries that you want to perform. You can specify one or more Alarm Providers and groups.
   c. In the From Priority box, type the minimum alarm priority value (1 to 999).
   d. In the To Priority box, type the maximum alarm priority value (1 to 999).
   e. Click the Alarm State arrow and select the alarm state that (All, Ack, Unack) you want to use in the alarm query.
   f. In the Display Type area, select Summary or Historical for the type of records you want to query.
4. Click OK to close the Add Query dialog box.
5. Click OK in the Alarm Query dialog box to add the query to your favorites.

**To modify an existing named query at run time**

1. Right-click the Alarm Viewer control and then click Query Favorites. The Alarm Query dialog box appears.
2. Select the named query that you want to modify in the list of currently defined queries.
3. Click Modify. The Modify Query dialog box appears.
4. Make the necessary modifications and then click OK.
5. Click OK in the Alarm Query dialog box.

**To delete an existing named query at run time**

1. Right-click the Alarm Viewer control and then click Query Favorites. The Alarm Query dialog box appears.
2. Select the named query that you want to delete in the list of currently defined queries.
3. Click Delete. When a message appears, click Yes.
4. Click OK in the Alarm Query dialog box.

**Using Alarm Viewer Control ActiveX Properties**

You can set the value an Alarm Viewer control property directly using a script or you can assign it to an InTouch tag or I/O reference. For more information about setting properties, see Scripting ActiveX Controls in the InTouch® HMI Scripting and Logic Guide.

The following table lists the Alarm Viewer control properties.

<table>
<thead>
<tr>
<th>Property</th>
<th>Type</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>AckAllMenu</td>
<td>Discrete</td>
<td>Enables/disables Ack All menu item.</td>
</tr>
<tr>
<td>AckAlmColorRange1</td>
<td>Integer</td>
<td>Sets color to be used to show acknowledged alarms with priorities in the range 1 to ColorPriorityRange1. The default priority range is 1 to 250.</td>
</tr>
<tr>
<td>AckAlmColorRange2</td>
<td>Integer</td>
<td>Sets color to be used to acknowledged alarms with priorities in the range ColorPriorityRange1 to ColorPriorityRange2. The default priority range is 250 to 500.</td>
</tr>
<tr>
<td>AckAlmColorRange3</td>
<td>Integer</td>
<td>Sets color to be used to acknowledged alarms with priorities in the range ColorPriorityRange2 to ColorPriorityRange3. The default priority range is 500 to 750.</td>
</tr>

<td>Integer</td>
<td>Sets the flashing color for unacknowledged alarms belonging to Alarm Priority Range 4.</td>
</tr>
<tr>
<td>Font</td>
<td>None</td>
<td>Sets the font for the records and the header in the control.</td>
</tr>
<tr>
<td>FreezeMenu</td>
<td>Discrete</td>
<td>Enables/disables the Freeze menu item.</td>
</tr>
<tr>
<td>FromPriority</td>
<td>Integer</td>
<td>Sets the low priority value of the default query.</td>
</tr>
<tr>
<td>GridColor</td>
<td>Integer</td>
<td>Sets the color of the background grid.</td>
</tr>
<tr>
<td>NewAlarmEventMode</td>
<td>Integer</td>
<td>Controls the triggering of the NewAlarm event.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>0 = The NewAlarm event can not be triggered. (Default).</td>
</tr>
<tr>
<td></td>
<td></td>
<td>1 = The NewAlarm event is active.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>2 = The NewAlarm event is active and continually triggers when at least one new unacknowledged alarm arrives.</td>
</tr>
<tr>
<td>QueryFavorite sFile</td>
<td>Message</td>
<td>Returns or sets the query favorites file name.</td>
</tr>
<tr>
<td>QueryFavorite sMenu</td>
<td>Discrete</td>
<td>Enables/disables the Query Favorites menu item.</td>
</tr>
<tr>
<td>QueryName</td>
<td>String</td>
<td>Returns the current query name.</td>
</tr>
<tr>
<td>QueryStartup</td>
<td>Discrete</td>
<td>Automatically begins updating the grid using default query properties, if set. Otherwise, you must run the ApplyDefaultQuery or ApplyQuery method in a script to update the grid.</td>
</tr>
<tr>
<td>QueryType</td>
<td>Message</td>
<td>Sets the display type as either Summary or Historical.</td>
</tr>
<tr>
<td>RequeryMenu</td>
<td>Discrete</td>
<td>Enables/disables Requery shortcut menu item.</td>
</tr>
<tr>
<td>RetainSuppression</td>
<td>Discrete</td>
<td>Retains alarm suppression between alarm queries when the alarm query is changed.</td>
</tr>
<tr>
<td>RowSelection</td>
<td>Discrete</td>
<td>Allows user to select alarms during run time.</td>
</tr>
<tr>
<td>SecondarySortColumn</td>
<td>Message</td>
<td>Returns or sets the current secondary sort column.</td>
</tr>
<tr>
<td>SelectedCount</td>
<td>Integer</td>
<td>Returns the total number of selected alarms.</td>
</tr>
<tr>
<td>ShowContextMenu</td>
<td>Discrete</td>
<td>Enables the activation of the shortcut menu.</td>
</tr>
<tr>
<td>ShowGrid</td>
<td>Discrete</td>
<td>Returns or sets a value that determines whether the grid lines are shown in the control.</td>
</tr>
<tr>
<td>Property</td>
<td>Type</td>
<td>Purpose</td>
</tr>
<tr>
<td>-------------------------</td>
<td>---------</td>
<td>-------------------------------------------------------------------------</td>
</tr>
<tr>
<td>ShowHeading</td>
<td>Discrete</td>
<td>Shows the title bar of the control.</td>
</tr>
<tr>
<td>ShowMessage</td>
<td>Discrete</td>
<td>Returns or sets a value that determines whether error messages are shown for the control.</td>
</tr>
<tr>
<td>ShowStatusBar</td>
<td>Discrete</td>
<td>Gets or sets a value that determines whether the status bar is shown.</td>
</tr>
<tr>
<td>SilentMode</td>
<td>Discrete</td>
<td>Gets or sets a value that determines whether the control is in silent mode.</td>
</tr>
<tr>
<td>SortColumn</td>
<td>Message</td>
<td>Gets or sets the current sort column.</td>
</tr>
<tr>
<td>SortMenu</td>
<td>Discrete</td>
<td>Enables/disables the Sort menu item.</td>
</tr>
<tr>
<td>SortOrder</td>
<td>Discrete</td>
<td>Gets or sets the sort direction. Possible values are “Ascending” and “Descending,” represented as 0 and 1 respectively.</td>
</tr>
<tr>
<td>StatsMenu</td>
<td>Discrete</td>
<td>Enables/disables the Stats menu item.</td>
</tr>
<tr>
<td>SuppressAllMenu</td>
<td>Discrete</td>
<td>Enables/disables the Suppress All menu item.</td>
</tr>
<tr>
<td>SuppressedAlarms</td>
<td>Integer</td>
<td>Gets the total number of suppressed alarms.</td>
</tr>
<tr>
<td>SuppressionMenu</td>
<td>Discrete</td>
<td>Enables/disables the Suppression menu item.</td>
</tr>
<tr>
<td>SuppressOthersMenu</td>
<td>Discrete</td>
<td>Enables/disables the Suppress Others menu item.</td>
</tr>
<tr>
<td>SuppressSelectedGroupsMenu</td>
<td>Discrete</td>
<td>Enables/disables the Suppress Selected Groups menu item.</td>
</tr>
<tr>
<td>SuppressSelectedMenu</td>
<td>Discrete</td>
<td>Enables/disables the Suppress Selected menu item.</td>
</tr>
<tr>
<td>SuppressSelectedPrioritiesMenu</td>
<td>Discrete</td>
<td>Enables/disables the Suppress Selected Priorities menu item.</td>
</tr>
<tr>
<td>SuppressSelectedTagsMenu</td>
<td>Discrete</td>
<td>Enables/disables Suppress Selected Tags menu item.</td>
</tr>
<tr>
<td>SuppressVisibleMenu</td>
<td>Discrete</td>
<td>Enables/disables the Suppress Visible menu item.</td>
</tr>
<tr>
<td>TimeFormat</td>
<td>Message</td>
<td>Sets the format of the alarm time stamps.</td>
</tr>
<tr>
<td>TitleBackColor</td>
<td>Integer</td>
<td>Sets title bar background color.</td>
</tr>
<tr>
<td>TitleForeColor</td>
<td>Integer</td>
<td>Sets title bar foreground color.</td>
</tr>
<tr>
<td>ToPriority</td>
<td>Integer</td>
<td>Sets the maximum priority for the alarm query.</td>
</tr>
<tr>
<td>TotalAlarms</td>
<td>Integer</td>
<td>Gets the number of alarms.</td>
</tr>
<tr>
<td>Property</td>
<td>Type</td>
<td>Purpose</td>
</tr>
<tr>
<td>-----------------------</td>
<td>------------</td>
<td>-------------------------------------------------------------------------</td>
</tr>
<tr>
<td>UnackAlarms</td>
<td>Integer</td>
<td>Gets the total number of unacknowledged alarms.</td>
</tr>
<tr>
<td>UnAckAlmColorRange1</td>
<td>Integer</td>
<td>Sets the color to be used to show unacknowledged alarms with priorities in the range of 1 to ColorPriorityRange1.</td>
</tr>
<tr>
<td>UnAckAlmColorRange2</td>
<td>Integer</td>
<td>Sets the color to be used to show unacknowledged alarms with priorities in the range of ColorPriorityRange1 to ColorPriorityRange2.</td>
</tr>
<tr>
<td>UnAckAlmColorRange3</td>
<td>Integer</td>
<td>Sets the color to be used to show unacknowledged alarms with priorities in the range of ColorPriorityRange2 to ColorPriorityRange3.</td>
</tr>
<tr>
<td>UnAckAlmColorRange4</td>
<td>Integer</td>
<td>Sets the color to be used to show unacknowledged alarms with priorities in the range of ColorPriorityRange3 to 999.</td>
</tr>
<tr>
<td>UnsuppressAllMenu</td>
<td>Discrete</td>
<td>Enables/disables Unsuppress All menu item.</td>
</tr>
<tr>
<td>UseDefaultAckComment</td>
<td>Discrete</td>
<td>If set to True, the default acknowledgement comment is used when the alarm is acknowledged. Otherwise, the operator is prompted to enter a comment.</td>
</tr>
<tr>
<td>WindowColor</td>
<td>Integer</td>
<td>Sets the grid background color.</td>
</tr>

</table>

**Configuring Colors for ActiveX Controls**

You specify a color as an integer value. The alarm ActiveX controls use the ABGR model for specifying color as a 32-bit integer, where:

- A = Transparency
- B = Blue
- G = Green
- R = Red

Transparency is not supported by the alarm ActiveX controls. Any values for the upper 8 bits are ignored.

For example, to set the color to Blue, use the following ABGR values:

- A = 0
- B = 255
- G = 0
- R = 0

The hexadecimal value for this color is 0x00FF0000. The decimal value is 16711680.

The following table shows examples of colors you can use:
### Using Alarm Viewer Control ActiveX Methods

You use the Alarm Viewer control ActiveX methods in scripts to:

- Acknowledge alarms.
- Suppress alarms.
- Get information about an alarm.
- Run alarm queries.
- Move and freeze the display.
- Sort alarm records.
- Select specific alarms.
- Show the shortcut menu, **About** dialog box, and **Alarm Statistics** dialog box.

For more information about calling methods, see Scripting ActiveX Controls in the InTouch® HMI Scripting and Logic Guide.

### Acknowledging Alarms During Run Time

Use the following methods to acknowledge alarms during run time.

- **AckSelected() Method** on page 66
- **AckAll() Method** on page 67
- **AckVisible() Method** on page 67
- **AckSelectedGroup() Method** on page 67
- **AckSelectedTag() Method** on page 68
- **AckSelectedPriority() Method** on page 68
- **AckGroup() Method** on page 68
- **AckPriority() Method** on page 69
- **AckTag() Method** on page 69

#### AckSelected() Method

Acknowledges alarms that are selected in the Alarm Viewer control at run time.

<table>
<thead>
<tr>
<th>Color</th>
<th>Hexadecimal Value</th>
<th>Decimal Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>White</td>
<td>0x00FFFFFF</td>
<td>16777215</td>
</tr>
<tr>
<td>Black</td>
<td>0x00000000</td>
<td>0</td>
</tr>
<tr>
<td>Blue</td>
<td>0x0000FF00</td>
<td>16711680</td>
</tr>
<tr>
<td>Red</td>
<td>0x000000FF</td>
<td>225</td>
</tr>
<tr>
<td>Green</td>
<td>0x000000FF</td>
<td>652880</td>
</tr>
</tbody>
</table>
**Syntax**

```
Object.AckSelected (Comment)
```

**Parameter**

- **Comment**
  - Alarm acknowledgment comment.

**Example**

Tag1 is defined as a message tag and the name of the control is AlarmViewerCtrl1.

```
Tag1 = "Alarm Comment"
#AlarmViewerCtrl1.AckSelected (Tag1)
```

---

### AckAll() Method

Acknowledges all the alarms in the current alarm query. Because the Alarm Viewer control has a limited display area, the AckAll() method can also acknowledge alarms not shown in the display.

**Syntax**

```
Object.AckAll (Comment)
```

**Parameter**

- **Comment**
  - Alarm acknowledgment comment.

**Example**

Tag1 is defined as a message tag and the name of the control is AlarmViewerCtrl1.

```
Tag1 = "Alarm Comment"
#AlarmViewerCtrl1.AckAll (Tag1)
```

---

### AckVisible() Method

Acknowledges only those alarms that are currently visible in the Alarm Viewer control.

**Syntax**

```
Object.AckVisible (Comment)
```

**Parameter**

- **Comment**
  - Alarm acknowledgment comment.

**Example**

Tag1 is defined as a message tag and the name of the control is AlarmViewerCtrl1.

```
Tag1 = "Alarm Comment"
#AlarmViewerCtrl1.AckVisible (Tag1)
```

---

### AckSelectedGroup() Method

Acknowledges all alarms that have the same group name as one or more selected alarms.

**Syntax**

```
Object.AckSelectedGroup (Comment)
```

**Parameter**

- **Comment**
  - Alarm acknowledgment comment.
Example
Tag1 is defined as a message tag and the name of the control is AlarmViewerCtrl1.
Tag1 = "Alarm Comment";
#AlarmViewerCtrl1.AckSelectedGroup (Tag1);

AckSelectedTag() Method
Acknowledges all alarms that have the same tag, group name and priority as one or more of the selected alarms.

Syntax
Object.AckSelectedTag (Comment)

Parameter
Comment
Alarm acknowledgment comment.

Example
Tag1 is defined as a message tag and the name of the control is AlarmViewerCtrl1.
Tag1 = "Alarm Comment";
#AlarmViewerCtrl1.AckSelectedTag (Tag1);

AckSelectedPriority() Method
Acknowledges all alarms that have the same priority range as one or more of the selected alarms.

Syntax
Object.AckSelectedPriority (Comment)

Parameter
Comment
Alarm acknowledgment comment.

Example
Tag1 is defined as a message tag and the name of the control is AlarmViewerCtrl1.
Tag1 = "Alarm Comment";
#AlarmViewerCtrl1.AckSelectedPriority (Tag1);

AckGroup() Method
Acknowledges all alarms for a given group name and provider.

Syntax
Object.AckGroup(ApplicationName, GroupName, Comment)

Parameter
ApplicationName
The name of the Application for example, \node1\Intouch
GroupName
The name of the group. For example, Turbine.
Comment
Alarm acknowledgment comment.

Example
The name of the control is AlarmViewerCtrl1.
AckPriority() Method

Acknowledges all of the alarms specified priority range having same provider name and group name.

**Syntax**

```
Object.AckPriority(ApplicationName, GroupName, FromPriority, ToPriority, Comment)
```

**Parameter**

- **ApplicationName**
  The name of the application. For example, \node1\Intouch

- **GroupName**
  The name of the group. For example, Turbine.

- **FromPriority**
  Starting priority of alarms. For example, 100.

- **ToPriority**
  Ending priority of alarms. For example, 900.

- **Comment**
  Alarm acknowledgment comment.

**Example**

The name of the control is AlarmViewerCtrl1.

```
#AlarmViewerCtrl1.AckPriority ("\Intouch", "Turbine", 100, 900, "Turbine acknowledgement Comment");
```

AckTag() Method

Acknowledges the alarms of the given tag name having the same provider name and group name within the given priority range.

**Syntax**

```
Object.AckTag(ApplicationName, GroupName, tag, FromPriority, ToPriority, Comment)
```

**Parameter**

- **ApplicationName**
  The name of the Application for example, \node1\Intouch

- **GroupName**
  The name of the group. For example, Turbine.

- **tag**
  The name of the alarm tag. For example, Valve1.

- **FromPriority**
  Starting priority of alarms. For example, 100.

- **ToPriority**
  Ending priority of alarms. For example, 900.

- **Comment**
  Alarm acknowledgment comment.

**Example**

The name of the control is AlarmViewerCtrl1.

```
#AlarmViewerCtrl1.AckTag ("\Intouch", "Turbine", Valve1, 100, 900, "Turbine acknowledgement Comment");
```
Suppressing Alarms During Run Time

Use the following methods to suppress alarms during run time:

- `ShowSuppression()` Method on page 70
- `SuppressSelected()` Method on page 70
- `SuppressAll()` Method on page 70
- `SuppressVisible()` Method on page 71
- `SuppressSelectedGroup()` Method on page 71
- `SuppressSelectedTag()` Method on page 71
- `SuppressSelectedPriority()` Method on page 71
- `UnSuppressAll()` Method on page 71
- `SuppressGroup()` Method on page 72
- `SuppressPriority()` Method on page 72
- `SuppressTag()` Method on page 72

**ShowSuppression() Method**

Shows the suppression dialog box, which contains all suppressed alarms.

**Syntax**

```csharp
Object.ShowSuppression()
```

**Example**

The name of the control is AlarmViewerCtrl1.

```csharp
#AlarmViewerCtrl1.ShowSuppression();
```

**SuppressSelected() Method**

Suppresses showing current and future occurrences of the selected alarm(s).

**Syntax**

```csharp
Object.SuppressSelected()
```

**Example**

The name of the control is AlarmViewerCtrl1.

```csharp
#AlarmViewerCtrl1.SuppressSelected();
```

**SuppressAll() Method**

Suppresses showing current and future occurrences of all active alarms.

**Syntax**

```csharp
Object.SuppressAll()
```

**Example**

The name of the control is AlarmViewerCtrl1.

```csharp
#AlarmViewerCtrl1.SuppressAll();
```
SuppressVisible() Method
Suppress showing current and future occurrences of any visible alarm.

Syntax
Object.SuppressVisible()

Example
The name of the control is AlarmViewerCtrl1.
#AlarmViewerCtrl1.SuppressVisible();

SuppressSelectedGroup() Method
Suppresses showing current and future occurrences of any alarm that belongs to the same Group and Provider of one or more selected alarms.

Syntax
Object.SuppressSelectedGroup()

Example
The name of the control is AlarmViewerCtrl1.
#AlarmViewerCtrl1.SuppressSelectedGroup();

SuppressSelectedTag() Method
Suppresses showing current and future occurrences of any alarm that belongs to the same tag name of one or more selected alarms having the same Group name, Provider name, and Priority range.

Syntax
Object.SuppressSelectedTag()

Example
The name of the control is AlarmViewerCtrl1.
#AlarmViewerCtrl1.SuppressSelectedTag();

SuppressSelectedPriority() Method
Suppresses showing current and future occurrences of any alarm that belongs to the same priority range of one or more selected alarms.

Syntax
Object.SuppressSelectedPriority()

Example
The name of the control is AlarmViewerCtrl1.
#AlarmViewerCtrl1 SuppressSelectedPriority();

UnSuppressAll() Method
Clears alarm suppression.

Syntax
Object.UnSuppressAll()

Example
The name of the control is AlarmViewerCtrl1.
#AlarmViewerCtrl1.UnSuppressAll();
SuppressGroup() Method

Suppresses showing current and future occurrences of any alarm that belongs to a given Group name.

Syntax

```plaintext
Object.SuppressGroup(ApplicationName, GroupName)
```

Parameter

- **ApplicationName**
  The name of the Application for example, \node1\Intouch

- **GroupName**
  The name of the group. For example, Turbine.

Example

The name of the control is AlarmViewerCtrl1.

```plaintext
#AlarmViewerCtrl1.SuppressGroup("\Intouch", "Turbine");
```

SuppressPriority() Method

Suppresses showing current and future occurrences of any alarm of the specified priority range, having the same Provider name and Group name.

Syntax

```plaintext
Object.SuppressPriority(ApplicationName, GroupName, FromPriority, ToPriority)
```

Parameter

- **ApplicationName**
  The name of the Application for example, \node1\Intouch

- **GroupName**
  The name of the group. For example, Turbine.

- **FromPriority**
  Starting priority of alarms. For example, 100.

- **ToPriority**
  Ending priority of alarms. For example, 900.

Example

The name of the control is AlarmViewerCtrl1.

```plaintext
#AlarmViewerCtrl1.SuppressPriority("\Intouch", "Turbine", 100, 900);
```

SuppressTag() Method

Suppresses showing current and future occurrences of any alarm emitted by a given tag name or group name and in the specified priority range.

Syntax

```plaintext
Object.SuppressTag(ApplicationName, GroupName, tag, FromPriority, ToPriority)
```

Parameter

- **ApplicationName**
  The name of the Application for example, \node1\Intouch.

- **GroupName**
  The name of the group. For example, Turbine.

- **tag**
  The name of the alarm tag. For example, valve 1.
FromPriority
Starting priority of alarms. For example, 100.

ToPriority
Ending priority of alarms. For example, 900.

Example
The name of the control is AlarmViewerCtrl1.
#AlarmViewerCtrl1.SuppressTag ("\Intouch", "Turbin", "Valve1", 100, 900);

Retrieving Information About a Particular Alarm
Use the GetItem() function to retrieve information about an alarm.

GetItem() Method
Returns the data at a specified row & column as string.

Syntax
Object.GetItem(Integer, message)

Parameters

Integer
An integer expression that evaluates to a specific row in the control.

Message
A string expression that evaluates to the column name in the control.

Example
The name of the control is AlmDbView1 and tag is defined as a Message tag.
tag = #AlmDbView1.GetItem(1, "Group");

Running Alarm Queries
Use the following methods to run queries.

- ShowQueryFavorites() Method on page 73
- Requery() Method on page 73
- ApplyQuery() Method on page 74
- ApplyDefaultQuery() Method on page 74
- SetQueryByName() Method on page 74

ShowQueryFavorites() Method
Shows the Query Favorites dialog box if the QueryFavoritesFile property contains a valid query favorite file name in .xml format.

Syntax
Object.ShowQueryFavorites()

Example
The name of the control is AlarmViewerCtrl1.
#AlarmViewerCtrl1.ShowQueryFavorites();

Requery() Method
Queries the alarm provider again.
Viewing Current Alarms

InTouch HMI Alarms and Events Guide

Syntax

Object.Requery()

Example

The name of the control is AlarmViewerCtrl1.

#AlarmViewerCtrl1.Requery();

ApplyQuery() Method

Performs the query as specified by its parameters Alarm Query, From and To Priorities, State of alarms to query for, and the type of alarms to retrieve.

Syntax

Object.ApplyQuery(AlarmQuery, FromPriority, ToPriority, State, Type)

Parameter

AlarmQuery

The alarm query. For example: \InTouch\$System

FromPriority

Starting priority of alarms. For example, 100.

ToPriority

Ending priority of alarms. For example, 900.

State

Specifies type of alarms to show. For example, "UnAck" or message tag. Valid states are All, UnAck, or Ack.

Type

Specifies type of query for example, Historical (Historical alarms) or Summary (Summary alarms).

Example

The name of the control is AlarmViewerCtrl1.

#AlarmViewerCtrl1.ApplyQuery("\InTouch\$System",100,900,"All","Historical");

ApplyDefaultQuery() Method

Performs a query using the FromPriority, ToPriority, AlarmState, QueryType, and AlarmQuery properties as specified at design time. The default properties can only be changed at development time and are not overwritten by other alarm queries.

Syntax

Object.ApplyDefaultQuery()

Example

The name of the control is AlarmViewerCtrl1.

#AlarmViewerCtrl1.ApplyDefaultQuery();

SetQueryByName() Method

Sets the current query as specified by the query name passed. The query must be in the query favorites file.

Syntax

Object.SetQueryByName(QueryName)
Parameter

QueryName
The name of the query as created by using query favorites. For example, Turbine Queries.

Example
The name of the control is AlarmTreeViewerCtrl1.

```csharp
#AlarmTreeViewerCtrl1.SetQueryByName("Turbine Queries");
```

Moving and Freezing the Display

Use the following functions to move or freeze the display:

- `MoveWindow()` Method on page 75
- `FreezeDisplay()` Method on page 76

MoveWindow() Method

Scrolls the alarms in the control in a specified way.

Syntax

```csharp
Object.MoveWindow(Option, Repeat)
```

Parameter

Option
The type of action to perform.

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>LineDn</td>
<td>Line down. The Repeat parameter controls the number of lines to be scrolled.</td>
</tr>
<tr>
<td>LineUp</td>
<td>Line up. The Repeat parameter controls the number of lines to be scrolled.</td>
</tr>
<tr>
<td>PageDn</td>
<td>Page down. The Repeat parameter controls the number of pages to be scrolled.</td>
</tr>
<tr>
<td>PageUp</td>
<td>Page up. The Repeat parameter controls the number of pages to be scrolled.</td>
</tr>
<tr>
<td>Top</td>
<td>To the top of the control</td>
</tr>
<tr>
<td>Bottom</td>
<td>To the bottom of the control</td>
</tr>
<tr>
<td>PageRt</td>
<td>Page to the right. The Repeat parameter controls the number of pages to be</td>
</tr>
<tr>
<td>PageLf</td>
<td>Page to the left. The Repeat parameter controls the number of pages to be</td>
</tr>
<tr>
<td>Right</td>
<td>Scrolls right. The Repeat parameter controls the number of columns to be</td>
</tr>
<tr>
<td>Left</td>
<td>Scrolls left. The Repeat parameter controls the number of columns to be</td>
</tr>
<tr>
<td>Home</td>
<td>Scrolls to the top row and left most column of the control.</td>
</tr>
</tbody>
</table>
Repeat
The number of times this operation should be repeated.

Example
The name of the control is AlarmViewerCtrl1.

```csharp
#AlarmViewerCtrl1.MoveWindow("Bottom", 0);
#AlarmViewerCtrl1.MoveWindow("LineUp", 3);
#AlarmViewerCtrl1.MoveWindow("PageLf", 7);
```

FreezeDisplay() Method
Freezes the display.

Syntax
```csharp
Object.FreezeDisplay(Freeze)
```

Parameter

Freeze
- True = Freezes the display.
- False = Unfreezes the display.

Example
Tag1 is defined as Memory discrete tag and the name of the control is AlarmViewerCtrl1.

```csharp
Tag1 = 1;
#AlarmViewerCtrl1.FreezeDisplay(Tag1);
```

Sorting Alarm Records
Use the following functions to sort alarm records:

- `ShowSort() Method` on page 76
- `SetSort() Method` on page 76

ShowSort() Method
Shows the Secondary Sort dialog box if the SortMenu property is enabled.

Syntax
```csharp
Object.ShowSort
```

Example
The name of the control is AlmDbView1.

```csharp
#AlmDbView1.ShowSort();
```

SetSort() Method
Sets the sort criteria as specified by the SortColumn and SortOrder properties.

Syntax
```csharp
Object.SetSort()
```

Example
The name of the control is AlarmViewerCtrl1.

```csharp
#AlarmViewerCtrl1.SetSort();
```

Showing Additional Information
Use the following functions to show the About dialog box and the Alarm Statistics dialog box:
• AboutBox() Method on page 77
• ShowStatistics() Method on page 77

AboutBox() Method
Shows the About dialog box.

Syntax
Object.AboutBox()

Example
The name of the control is AlarmPareto1.
#AlarmPareto1.AboutBox();

ShowStatistics() Method
Shows the Alarm Statistics dialog box.

Syntax
Object.ShowStatistics()

Example
The name of the control is AlarmViewerCtrl1.
#AlarmViewerCtrl1.ShowStatistics();

Selecting Specific Alarms
Use the following functions to select specific alarms:
• SelectGroup() Method on page 77
• SelectPriority() Method on page 78
• SelectTag() Method on page 78
• SelectAll() Method on page 78
• SelectItem() Method on page 79
• UnSelectAll() Method on page 79

SelectGroup() Method
Selects all of the alarms that contain the same alarm group name and provider name.

Syntax
Object.SelectGroup(ApplicationName, GroupName)

Parameter

  ApplicationName
  The name of the Application for example, \node1\Intouch

  GroupName
  The name of the group. For example, Turbine.

Example
The name of the control is AlarmViewerCtrl1.
#AlarmViewerCtrl1.SelectGroup("\Intouch", "Turbine");
SelectPriority() Method

Selects all of the alarms that are of the specified priority range, having the same provider name and group name.

Syntax

```
Object.SelectPriority(ApplicationName, GroupName, FromPriority, ToPriority)
```

Parameter

- **ApplicationName**
  The name of the Application for example, \node1\Intouch

- **GroupName**
  The name of the group. For example, Turbine.

- **FromPriority**
  Starting priority of alarms. For example, 100.

- **ToPriority**
  Ending priority of alarms. For example, 900.

Example

The name of the control is AlarmViewerCtrl1.
```
#AlarmViewerCtrl1.SelectPriority ("\Intouch", "Turbine", 100, 900);
```

SelectTag() Method

Selects all of the alarms from a specific Provider/Group/Tag. You can also specify a Priority range, or use 1-999.

Syntax

```
Object.SelectTag(ApplicationName, GroupName, tag, FromPriority, ToPriority)
```

Parameter

- **ApplicationName**
  The name of the Application for example, \node1\Intouch

- **GroupName**
  The name of the group. For example, Turbine.

- **tag**
  The name of the alarm tag. For example, valve 1.

- **FromPriority**
  Starting priority of alarms. For example, 100.

- **ToPriority**
  Ending priority of alarms. For example, 900.

Example

The name of the control is AlarmViewerCtrl1.
```
#AlarmViewerCtrl1.SelectTag ("\Intouch", "Turbine", "Valve1", 100, 900);
```

SelectAll() Method

Toggles the selection of all the alarms in a display. Because the alarm display has only a limited display area, the SelectAll() function may select alarms that are not visible in the display.

Syntax

```
Object.SelectAll()
```
Example

```csharp
#AlarmViewerCtrl1.SelectAll();
```

**SelectItem() Method**

Toggles the selection of an alarm record at a given row.

**Syntax**

```csharp
Object.SelectItem(RowNumber)
```

**Parameter**

- `RowNumber`
  
  An integer value that is the row number for the alarm record to select. The first row in the control is 0.

**Example**

The name of the control is AlarmViewerCtrl1 and Tag1 is defined as a memory integer. This toggles the selection of the tenth alarm record in the Alarm Viewer control.

```csharp
Tag1 = 9;
#AlarmViewerCtrl1.SelectItem(Tag1);
```

**UnSelectAll() Method**

Unselects all the selected records.

**Syntax**

```csharp
Object.UnSelectAll()
```

**Example**

The name of the control is AlarmViewerCtrl1.

```csharp
#AlarmViewerCtrl1.UnSelectAll();
```

**Showing the Context Menu at Run Time**

Use the ShowContext() method to show the shortcut menu at run time.

**ShowContext() Method**

Shows the shortcut menu if any one of RefreshMenu or ResetMenu or SortMenu property is enabled.

**Syntax**

```csharp
Object.ShowContext
```

**Example**

The name of the control is AlmDbView1.

```csharp
#AlmDbView1.ShowContext();
```

**Handling Errors when Using Methods and Properties**

You can use the SilentMode property to hide errors during run time. If the SilentMode property is set to 1, the Alarm Viewer control does not show error messages during run time. If it is set to 0, the Alarm Viewer control shows error messages. Error messages are always sent to the ArchestrA Log Viewer.

**Using ActiveX Events to Trigger Scripts**

You can assign QuickScripts to Alarm Viewer control events, such as a mouse click or double-click. When the event occurs, the QuickScript runs.

The Alarm Viewer control supports the following events:
• Click
• DoubleClick
• NewAlarm
• ShutDown
• StartUp

The Click event has one parameter called ClicknRow, which identifies the row that is clicked at run time.
The DoubleClick event has one parameter called DoubleClicknRow, which identifies the row that is
double-clicked at run time.

Click and DoubleClick events are zero-based. When Click and/or DoubleClick events are published for
the user, the row count in the display starts with 0.

**Note:** The Alarm Viewer control ignores the user interface methods when they are called from StartUp
event because the control is not visible yet. These include: ShowSort(), ShowContext(),
GetSelectedItem(), GetNext(), GetPrevious() and AboutBox().

For more information about scripting ActiveX events, see Scripting ActiveX Controls in the InTouch® HMI
Scripting and Logic Guide.

**Running a Script When a New Alarm is Detected**

You can configure the Alarm Viewer control to run an ActiveX event script when the Alarm Viewer control
detects a new unacknowledged alarm (that is, any alarm that transitions from a normal state to an
unacknowledged state and meets the control's query and priority filtering criteria).

The NewAlarmEventMode property controls triggering the NewAlarm event.

- If you set NewAlarmEventMode property to 0, the NewAlarm event does not trigger. This is the
default.
- If you set the NewAlarmEventMode property to 1, and a new alarm occurs:
  - An event is triggered.
  - The ActiveX event script associated with the NewAlarm event runs.
  - The NewAlarmEventMode property is set to 0.

You must change the NewAlarmEventMode property back to 1 to process subsequent events.

Use this setting if the application performs an action that should not be performed again until the
condition has been corrected or acknowledged. For example, when the event triggers, the ActiveX
script can play an alarm sound until the alarm is acknowledged. Then the alarm sound can play
again the next time a new alarm is received.

- If you set the NewAlarmEventMode property to 2, the NewAlarm event is active and continually
  triggers when at least one new unacknowledged alarm arrives. You do not need to change the value
to process subsequent events. The new event triggers at most one time per second, regardless of
how many additional new alarms arrive in the same second.
CHAPTER 5

Acknowledging Alarms in Real Time

Using Alarm and Acknowledgement Comments ....................................................................... 90

About Acknowledging Alarms in Real Time

When tag data transitions from a normal to an alarm state, a new instance of its alarm is generated. The InTouch Distributed Alarm system tracks each alarm instance through the following states:

- When the tag first enters the alarmed state
- When the alarm makes a sub-state transition, if the alarm is a multi-state alarm
- When the alarm returns to normal
- Whether the alarm is waiting for an acknowledgment
- When the alarm is acknowledged

The life cycle of an alarm instance ends when the tag value associated with the alarm returns to a normal, unalarmed state. A subsequent transition to the alarmed state generates a new alarm instance.

Understanding Alarm Acknowledgement Models

The InTouch HMI supports three models of alarm acknowledgement:

- For condition-oriented alarms, an acknowledgment counts against all entries into the alarmed state up to the time of the acknowledgment.
- For expanded summary alarms, an acknowledgment is only for a particular transition, whether to an alarmed state, to a sub-state, or a return to normal. All transitions into different alarm sub-states must be acknowledged before the overall alarm is considered acknowledged.
- For event-oriented alarms (as in OPC), an acknowledgment is accepted only if it refers to the most recent activation event.

Condition Acknowledgement Alarm Model

For condition-oriented alarms, an acknowledgment counts against all entries into the alarmed state up to the time of the acknowledgment.
Acknowledgment is for the instance of the alarm. An alarm instance waits for an acknowledgement when it first enters the alarmed state. If the alarm is acknowledged and subsequently transitions to a new alarmed sub-state (for example from "Hi" to HiHi"), it begins waiting for another acknowledgement. Whenever the acknowledgement is received, it is accepted and applies to all transitions of the alarm that have occurred so far.

The alarm is considered acknowledged when the most recent instance is acknowledged.

**Expanded Summary Alarm Model**

For expanded summary alarms, an acknowledgment is only for a particular transition, whether to an alarmed state, to a sub-state, or a return to normal. All transitions into different alarm sub-states must be acknowledged before the overall alarm is considered acknowledged.

The initial entry to the alarmed state must be acknowledged, and the return to normal must also be separately acknowledged.

Any transition to a new alarm sub-state is treated as a new occurrence that must be acknowledged, and whose return to normal must also be acknowledged. Sub-state transitions are treated as belonging to a "return to normal group," starting with the first entry into an alarmed state when the item was previously normal.

If the item returns to normal and subsequently enters the alarmed state again, a new return to normal group is created.

Each transition must be acknowledged individually and explicitly; and the alarm is considered acknowledged only when the item has returned to normal and all transitions in all pending return to normal groups have been acknowledged.

*Note:* The term "summary" means "awaiting acknowledgment." Alarms in this model are also known as "ring-back" alarms.

**Expanded Summary Alarm Records**

For expanded summary alarms, when an alarm occurs, a record is generated in the alarm display object showing that an alarm condition has occurred. The record shows the date and time stamp of the alarm. This record remains visible until an operator acknowledges the alarm and a return-to-normal state has occurred. If the return-to-normal state occurs before the alarm is acknowledged, then two records are shown in the alarm object.

For example, a boiler's temperature exceeds the high limit state and triggers an alarm. Later, the boiler returns to its normal temperature range before an operator can acknowledge the alarm. The alarm system generates a record that a high limit alarm occurred and an another record indicating the alarm was not acknowledged.

**Using Expanded Summary Alarms**

When you define a tag and select **Expanded Summary** as its acknowledgement model, an operator must acknowledge that an alarm occurred even if the state triggering the alarm has returned to normal. Acknowledging an alarm changes the color of the alarm entry but does not change the time stamp. Alarms only clear from the display when they are acknowledged and the alarm has returned to a normal state.

*Note:* When you define a tag with the expanded summary acknowledgement mode, the **RTN Implies ACK** option in the Alarm Properties dialog box does not apply to the tag.
**Event-Based Alarm Model**

For event-oriented alarms (as in OPC), an acknowledgment is accepted only if it refers to the most recent activation event.

An alarm instance begins waiting for an acknowledgement when it first enters the alarmed state. If the instance is acknowledged and subsequently transitions to a new alarmed sub-state, it begins waiting for another acknowledgment. Each subsequent transition is assigned a sequence number, and the acknowledgement must have attached to it the sequence number of the transition to which it is responding.

The acknowledgement is accepted only if it is for the most recent transition. If it is accepted, it applies to all transactions of the alarm that have occurred so far. The alarm is considered acknowledged when the most recent instance is acknowledged.

A rejected acknowledgement may be logged for diagnostic purposes, but is not otherwise tracked in the system.

The event-oriented model ensures that if an alarm is changing between different states, the acknowledgement corresponds to current information. In systems with small latency times, this may look just like condition-oriented alarms. In other environments, such as the Internet, the features of this model may become important.

**Checking the Acknowledgement Model of a Tag at Run Time**

Use the .AlarmAckModel dotfield to monitor the acknowledgement model associated with a tag.

*.AlarmAckModel Dotfield*

Monitors the acknowledgment model associated with a tag as follows:

- 0 = condition (default)
- 1 = event oriented
- 2 = expanded summary

**Category**

Alarms

**Usage**

_tagname_.AlarmAckModel

**Parameter**

_tagname_

Any discrete, integer, real, indirect discrete and analog tag.

**Remarks**

This dotfield defaults to 0 (condition acknowledgment model).

**Data Type**

Analog (read-only)

**Valid Values**

0, 1 or 2

**Example**

The body of this IF-THEN statement is processed if the PumpStation tag is associated with an event alarm:

| IF (PumpStation.AlarmAckModel == 1) THEN |
Acknowledging Alarms in Real Time

InTouch HMI Alarms and Events Guide

See Also

Using Dotfields to Acknowledge Alarms

You can create scripts that use dotfields to acknowledge all current alarms, selected alarms, or only alarms of a specific type.

Acknowledging Alarms or Alarm Groups

You can create scripts that use the following dotfields to acknowledge alarms of specified local tags or alarms within specified alarm groups.

- .Ack Dotfield on page 84
- .UnAck Dotfield on page 85

You cannot acknowledge alarms that originate from the Application Server using these dotfields.

To acknowledge all local alarms of the running InTouch application, use the $System alarm group in combination with the appropriate .Ack dotfield.

.Ack Dotfield

Monitors or controls the alarm acknowledgment status of all types of local alarms.

Category

Alarms

Usage

TagName.Ack=1;

Parameter

TagName

Any discrete, integer, real, indirect discrete and analog tag, or alarm group.

Remarks

Set this dotfield to a value of 1 to acknowledge any outstanding alarms associated with a specified tag or alarm group. When the specified tag is an alarm group, all unacknowledged alarms associated with the tags within the specified group are acknowledged. When the specified tag is of any type other than alarm group, only the unacknowledged alarm associated with that tag is acknowledged. Setting the .Ack dotfield to a value other than 1 has no meaning.

Data Type

Discrete (read/write)

Valid Values

1

Example

The following statement acknowledges an alarm associated with the Tag1 tag:

Tag1.Ack=1;

This next example would be used to acknowledge all unacknowledged alarms within the PumpStation alarm group:

PumpStation.Ack=1;
Acknowledging Alarms in Real Time

InTouch HMI Alarms and Events Guide

Note: The .ACK dotfield has an inverse dotfield called .UnAck. When an unacknowledged alarm occurs, .UnAck is set to 1. .UnAck can then be used with animation links or in condition scripts to trigger annunciators for any unacknowledged alarms.

See Also
Alarm, UnAck, AckDev, AckROC, AckDSC, AckValue, AlarmAckModel

.UnAck Dotfield

Monitors or controls the alarm acknowledgment status of local alarms.

Category
Alarms

Usage
```
TagName.UnAck=0;
```

Parameter

TagName
Any discrete, integer, real, indirect discrete and analog tag, or alarm group.

Remarks
Set this dotfield to a value of 0 to acknowledge any outstanding alarms associated with the specified tag or alarm group. When the specified tag is an alarm group, all unacknowledged alarms associated with the tags within the specified group are acknowledged. When the specified tag is any other type, only the unacknowledged alarm associated with that tag is acknowledged. Setting this dotfield to a value other than 0 has no meaning.

Data Type
Discrete (read/reset) only

Valid Values
0

Example
The following statement acknowledges any alarm associated with the Tag1 tag.
```
Tag1.UnAck=0;
```

This statement acknowledges all unacknowledged alarms within the alarm group named PumpStation.
```
PumpStation.UnAck=0;
```

.UnAck has an inverse dotfield called .Ack. When an alarm has been acknowledged, the value of the .Ack dotfield is set to 1.

See Also
.Ack, Ack(), .Alarm, .AlarmAckModel

Acknowledging Value Alarms

You can create scripts that use the .AckValue dotfield to acknowledge all value alarms of a specified local tag or all value alarms in a specified alarm group.

.AckValue Dotfield

Monitors and controls the acknowledgment of local value alarms.
Acknowledging Alarms in Real Time

Usage

<TagName>.AckValue=1;

Parameter

<TagName>
   Any integer, real, indirect analog tag, or alarm group.

Remarks

Set the .AckValue dotfield to 1 to acknowledge any outstanding value alarms associated the specified tag/group. When the specified tag is an alarm group, all unacknowledged value alarms associated with the tags within the specified group are acknowledged. When the specified tag is of any type, only the unacknowledged value alarm associated with that tag is acknowledged.

Setting this dotfield to a value other than 1 has no meaning.

Data Type

Discrete (read/write)

Valid Values

1

Examples

The following statement acknowledges a value alarm associated with the Tag1 tag:
<Tag1>.AckValue=1;

This example acknowledges all unacknowledged value alarms within the alarm group named PumpStation:
<PumpStation>.AckValue=1;

An indirect alarm group (using GroupVar) can be used to acknowledge value alarms. For example, using an assignment such as:
StationAlarms.Name = "PumpStation";

Where StationAlarms is defined as an alarm group type tag and is then associated with PumpStation.
Thus, the statement below is similar to the above examples, except it is used to acknowledge any unacknowledged value alarms within the alarm group PumpStation, which is currently associated with the StationAlarms alarm group tag.
<StationAlarms>.AckValue=1;

See Also

Acknowledging Discrete Alarms

You can create scripts that use the .AckDsc dotfield to acknowledge the discrete alarm of a specified tag or all discrete alarms of a specified alarm group.

.AckDsc Dotfield

Acknowledges the discrete alarm of a specified tag or all discrete alarms of a specified alarm group.

Usage

<TagName>.AckDsc=1;

Parameter

<TagName>
   Name assigned to the discrete tag or the name of an alarm group.
Remarks
Set to 1 to acknowledge an active discrete alarm associated with the specified tag or alarm group. When the specified tag is an alarm group, all unacknowledged discrete alarms associated with the tags within the specified group are acknowledged. When the specified tag is of any type other than alarm group, only the unacknowledged discrete alarm associated with that tag is acknowledged. Setting this dotfield to a value other than 1 has no meaning.

Data Type
Discrete (read/write)

Valid Values
0 or 1

Examples
The following statement verifies if Tag1 has an active discrete alarm associated with it:

```plaintext
IF (Tag1.AlarmDsc == 1) THEN
   MyAlarmMessage="The pumping station currently has an ALARM!";
ENDIF;
```

This dotfield is not linked to the .Ack or .UnAck dotfield. Therefore, even when an active alarm has been acknowledged, this dotfield remains equal to 1.

See Also

Acknowledging Deviation Alarms
You can create scripts that use the .AckDev dotfield to acknowledge the minor or major deviation alarm of a specified local tag or the deviation alarms of a specified alarm group.

.AckDev Dotfield
Acknowledges the minor or major deviation alarms of a specified local tag or all deviation alarms of a specified alarm group.

Category
Alarm

Usage
TagName.AckDev=1;

Parameter
TagName
Any integer, real, indirect analog tag, or alarm group.

Remarks
Set this dotfield to a value of 1 to acknowledge any outstanding deviation alarms associated with the specified tag or alarm group. When the specified tag is an alarm group, all unacknowledged deviation alarms associated with the tags within the specified group are acknowledged. Setting this dotfield to a value other than 1 has no meaning.

Data Type
Discrete (read/write)

Valid Values
1
Example

The following statement acknowledges a deviation alarm associated with the Tag1 tag:

```
Tag1.AckDev=1;
```

This next example would be used to acknowledge all unacknowledged deviation alarms within the alarm group named PumpStation:

```
PumpStation.AckDev=1;
```

See Also

Acknowledging Rate-of-Change Alarms

You can create scripts that use the .AckROC dotfield to acknowledge the rate-of-change alarm of a specified local tag or the rate-of-change alarms of a specified alarm group.

.AckROC Dotfield

Acknowledges the rate-of-change alarm of a specified local tag or all rate-of-change alarms of a specified alarm group.

Usage

```
TagName.AckROC=1;
```

Parameter

```
TagName
```

Name assigned to the integer, real, or indirect analog tag or the name of an alarm group.

Remarks

Set this dotfield to a value of 1 to acknowledge any outstanding rate-of-change alarms associated with a specified tag or alarm group. When the specified tag is an alarm group, all unacknowledged rate-of-change alarms associated with the tags within the specified group are acknowledged. When the specified tag is of any type other than alarm group, only the unacknowledged rate-of-change alarm associated with that tag is acknowledged. Setting this dotfield to a value other than 1 has no meaning.

Data Type

Discrete (read/write)

Valid Values

1

Examples

The following statement acknowledges a rate-of-change alarm associated with a tag named Tag1.

```
Tag1.AckROC=1;
```

This next example acknowledges all unacknowledged rate-of-change alarms within the alarm group named PumpStation:

```
PumpStation.AckROC=1;
```

See Also

Using Script Functions to Acknowledge Alarms

You can use the Ack() script function to acknowledge all alarms for a tag or group.
If you are using the Alarm Viewer control, you can acknowledge alarms using methods. For more information, see *Acknowledging Alarms* on page 318.

If you are using the Distributed Alarm Display object, use script functions to acknowledge alarms. For more information, see *Acknowledging Alarms* on page 318.

**Ack() Function**

Acknowledges any unacknowledged InTouch alarm.

**Category**

Alarm

**Syntax**

```
Ack TagName;
```

**Arguments**

```
TagName
Any InTouch tag, alarm group, or group variable.
```

**Remarks**

This function can be applied to a tag or an alarm group.

**Examples**

The following statements can be used on a push button to acknowledge any unacknowledged alarm:

```
Ack $System; {All alarms}
Ack Tagname;
Ack GroupName;
```

**See Also**

`almAckAll()`, `almAckGroup()`, `almAckTag()`, `almAckDisplay()`, `almAckRecent()`, `almAckPriority()`, `almAckSelect()`, `almAckSelectedGroup()`, `almAckSelectedPriority()`, `almAckSelectedTag()`

**Using Automatic Acknowledgement When the Tag Value Returns to Normal**

The InTouch HMI can automatically acknowledge an alarm when an alarmed tag's value returns to its normal state. This option does not apply to expanded summary alarms.

**To configure alarm acknowledgement on return**

1. On the **Special** menu, point to **Configure**, and then click **Alarms**. The **Alarm Properties** dialog box appears.

2. Select the **RTN implies ACK** check box to have the InTouch HMI automatically acknowledge alarms whose values return to the normal state (RTN).
3. Click **OK**.

### Using Alarm Clients to Acknowledge Alarms

Operators acknowledge alarms that appear in the Alarm Viewer control from WindowViewer.

In the display, the **State** column shows the current acknowledgement status of the alarm record you select. Also, the text of a record is color coded to indicate its acknowledgement status.

The alarms you acknowledge are removed from the display.

#### To acknowledge all alarms

1. Right-click in the display, point to **Ack Others**, and then click the appropriate command:
   - Click **Ack All** to acknowledge all current alarms.
   - Click **Ack Visible** to acknowledge all alarms visible in the display.
   - The **Ack Comment** dialog box appears.
2. Type an optional acknowledgement comment and click **OK**.

#### To acknowledge selected alarms

1. Select one or more alarms.
2. Right-click and then click **Ack Selected**. The **Ack Comment** dialog box appears.
3. Type an optional acknowledgement comment and click **OK**.

#### To acknowledge alarms by group, tag, or priority

1. Select the alarm(s).
2. Right-click in the display, point to **Ack Others**, and then click the appropriate command:
   - Click **Ack Selected Groups** to acknowledge all alarms that belong to the selected alarm group(s).
   - Click **Ack Selected Tags** to acknowledge alarms for all tags that have the same name(s) as the selected alarm(s).
   - Click **Ack Selected Priorities** to acknowledge all alarms with the same priority or priorities as the selected alarm(s).
   - The **Ack Comment** dialog box appears.
3. Type an optional acknowledgement comment and click **OK**.

### Using Alarm and Acknowledgement Comments

There are two kinds of comments: alarm comments and acknowledgement comments.
The alarm comment is set when the new alarm instance occurs. The .AlarmComment dotfield is used for alarm comments and can be set or read in an InTouch script. You specify the default value for this comment in the tag’s definition in the Tagname Dictionary. Alarm comments can be up to 131 characters.

The acknowledgement comment is provided by the operator when he or she acknowledges the alarm.

You can use the acknowledgement comment to update the alarm comment in the tag database.

**To allow alarm acknowledgement comments to update the .AlarmComment dotfield**

1. On the **Special** menu, point to **Configure**, and then click **Alarms**. The **Alarm Properties** dialog box appears.

2. Select the **Retain ACK Comment As Alarm Comment** check box to update the tag’s .AlarmComment dotfield and the Tagname Dictionary with the comments entered with alarm acknowledgments.

   If you do not select this check box, the acknowledgment comment is shown with the acknowledged alarm (in the database, printouts, and displays), but .AlarmComment does not change.

3. Click **OK**.

About Controlling Alarm Properties of Tags and Groups at Run Time
You can use alarm dotfields to dynamically manage alarm conditions. Many of these dotfields are accessible using I/O, expressions, and scripts. Through I/O access, you can monitor and control a specific tag's alarm information using other Windows applications, such as Excel, or WindowViewer running on a remote node.

To access dotfields associated with a tag, use this syntax:

tag.dotfield

For example, if you want to allow run-time changes to the HiHi alarm limit on a tag named Analog_tag, you can create an Analog - User Input touch link to a button and enter Analog_tag.HiHiLimit as the expression in the link’s dialog box. During run time, the operator simply clicks the button and types in a new value for the HiHi alarm limit assigned to the Analog_tag.

The following table briefly describes each alarm dotfield.

<table>
<thead>
<tr>
<th>Dotfield</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>.Ack</td>
<td>Monitors/controls the alarm acknowledgment status of tags and alarm groups. .Ack has an inverse tag dotfield called .UnAck. When an unacknowledged alarm occurs, .UnAck is set to 1. The .UnAck dotfield can be used in animation links or condition scripts to trigger annunciators for any unacknowledged alarms.</td>
</tr>
<tr>
<td>.AckDev</td>
<td>Monitors/controls the alarm acknowledgment status of deviation type alarms active on an analog tag or alarm group.</td>
</tr>
</tbody>
</table>
### Dotfield | Description
---|---
.AckDsc | Monitors/controls the current acknowledgement status of a discrete tag.
.AckROC | Monitors/controls the alarm acknowledgment status of rate-of-change type alarms active on the tag.
.AckValue | Monitors the alarm acknowledgment status of value type alarms active on the tag.
.Alarm | Signals that an alarm condition exists.
.AlarmAckModel | Monitors the acknowledgement model associated with the tag as follows:
0 = condition (default)
1 = event
2 = expanded
Applies to discrete or analog tags with alarms. Read only, but can be configured in WindowMaker.
.AlarmDev | Signals that a deviation alarm exists.
.AlarmDevCount | Tracks the total number of active deviation alarms for a given tag or alarm group.
.AlarmDevDeadband | Monitors/controls the deviation percentage deadband for both minor and major deviation alarms.
.AlarmDevUnAckCount | Tracks the number of unacknowledged deviation alarms active on a given tag or alarm group.
.AlarmDisabled | Disables/enables events and alarms. Applies to discrete and analog tags with alarms, or to alarm groups.
.AlarmDsc | Indicates that a discrete alarm condition is currently active.
.AlarmDscCount | Tracks the total number of discrete alarms active on a given tag or alarm group.
.AlarmDscDisabled | Indicates whether or not the tag can generate discrete alarms.
**Note:** This dotfield is the same as .AlarmDisabled dotfield for a discrete tag.
.AlarmDscEnabled | Indicates whether or not the tag can generate discrete alarms.
**Note:** This dotfield is the same as .AlarmEnabled dotfield for a discrete tag.
.AlarmDscInhibitor | Returns the name of the inhibitor tag assigned to the discrete alarm (if any) for this tag.
.AlarmDscUnAckCount | Tracks the total number of unacknowledged discrete alarms active for a given tag or alarm group.

</tr>
<tr>
<td><code>.ROCStatus</code></td>
<td>Read only discrete dotfield used to determine whether a rate-of-change alarm exists for the specified tag.</td>
</tr>
</tbody>
</table>

### Determining if Tags or Alarm Groups are in an Alarm Condition

Use the following dotfields and a system tag to determine the status of alarms in a running application. You can find out if a new alarm occurred or whether a tag or alarm group is in alarm or is the normal state. You can also find out the status of discrete, deviation, and rate-of-change alarms.

- `$NewAlarm System Tag` on page 98
- `$System System Tag` on page 98
Controlling Alarm Properties of Tags and Groups at Run Time

InTouch HMI Alarms and Events Guide

- .Alarm Dotfield on page 99
- .Normal Dotfield
- .AlarmDsc Dotfield on page 100
- .AlarmDev Dotfield on page 101
- .AlarmROC Dotfield on page 101
- .LoStatus Dotfield on page 102
- .LoLoStatus Dotfield
- .HiStatus Dotfield on page 103
- .HiHiStatus Dotfield on page 104
- .MinorDevStatus Dotfield on page 105
- .MajorDevStatus Dotfield on page 105
- .ROCStatus Dotfield on page 106

$NewAlarm System Tag

Set to 1 if a new alarm occurs in a running application. The $NewAlarm system tag is not set for remote alarms.

**Syntax**

```plaintext
$NewAlarm=value;
```

**Data Type**
Discrete (read/write)

**Valid Values**
0 or 1

**Remarks**

Associate the $NewAlarm system tag with an animation object in an application window. For example, associate the tag with an acknowledgment button that an operator clicks to reset the value of the tag to 0 and acknowledge the alarm. You can also link the $NewAlarm system tag to the PlaySound logic function to sound an audible warning when an alarm occurs.

**Example**

Add a button to an alarm acknowledgement window and attach the following action script that runs when the operator clicks the button.

```plaintext
Ack $System;
$NewAlarm=0;
HideSelf;
```

When the operator clicks on the button, all alarms are acknowledged, the $NewAlarm system tag is reset to 0, and the alarm acknowledgement window is hidden from view.

$System System Tag

The default alarm group.

**Category**
alarms
Usage

\$System

Remarks

By default, tags are assigned to this root alarm group. All defined alarm groups are descendants of \$System.

Data Type

System alarm group

Example(s)

\$System.Ack = 1; \{Acknowledges All Alarms\}

.Alarm Dotfield

Returns 0 when a specified tag or alarm group is not currently in an alarm state. When an alarm occurs, the .Alarm dotfield returns 1. It remains at 1 until the alarm condition no longer exists. The .Alarm dotfield has an inverse dotfield called .Normal.

If the specified tag is the name of an alarm group, the .Alarm dotfield returns 1 if any of the tags that belong to the group are in an alarm state.

Category

Alarms

Usage

TagName.Alarm

Parameter

TagName

Any discrete, integer, real tag, indirect discrete and analog tag, or alarm group tag.

Data Type

Discrete (read-only)

Valid Values

0 or 1

Example

The following statement verifies if Tag1 has an active alarm associated with it:

IF (Tag1.Alarm == 1) THEN

The body of this IF-THEN statement is processed if active alarms exist within the PumpStation alarm group.

IF (PumpStation.Alarm == 1) THEN

  MyAlarmMessage="The pumping station currently has an ALARM!";

ENDIF;

This dotfield is not linked to the .Ack or .UnAck dotfields. Therefore, even when an active alarm has been acknowledged, .Alarm remains equal to 1.

.Normal Dotfield

Returns 1 when a specified tag is not in an alarm condition. When an alarm occurs, the .Normal dotfield returns 0. The .Normal dotfield has an inverse dotfield called .Alarm.

Category

Alarms
Syntax

*TagName*.Normal

Parameter

TagName
Any discrete, integer, real tag, indirect discrete and analog tag, or alarm group tag.

Data Type
Discrete (read-only)

Valid Values
0 or 1

Example

The following IF-THEN statement runs when there are no alarms associated with the Tag1 tag. When there is one or more alarms active for Tag1, the "ELSE" body runs:

```
IF (Tag1.Normal==1) THEN
   MyOperatorMessage="Tag1 is OK - No alarms associated with it";
ELSE
   MyOperatorMessage="Tag1 has one or more alarms active!";
ENDIF;
```

.AlarmDsc Dotfield

Indicates whether an alarm condition exists for a specified discrete tag or alarm group. The default value is 0. When a discrete alarm condition exists for the specified tag, it is set to a value of 1. The value remains 1 until the alarm condition no longer exists.

If the specified tag is the name of an alarm group, the .AlarmDsc dotfield is set to 1 if any of the tags within the group are in an active discrete alarm.

Category

Alarms

Usage

*TagName*.AlarmDsc

Parameter

TagName
Any discrete tag, indirect discrete tag, or alarm group.

Data Type
Discrete (read-only)

Valid Values
0 or 1

Example

The following statement verifies if Tag1 has an active discrete alarm associated with it:

```
IF (Tag1.AlarmDsc == 1) THEN
   MyAlarmMessage="The pumping station currently has an ALARM!";
ENDIF;
```

This dotfield is not linked to the .Ack or .UnAck dotfields. Therefore, even when an active alarm has been acknowledged, the .AlarmDsc dotfield remains equal to 1.
Controlling Alarm Properties of Tags and Groups at Run Time

InTouch HMI Alarms and Events Guide

See Also

.AlarmDev Dotfield
Indicates when a deviation alarm becomes active for the specified tag or alarm group. The default value is 0. When a deviation alarm condition exists for the specified tag, it is set to a value of 1. The value remains 1 until the alarm condition no longer exists.

If the specified tag is the name of an alarm group, the .AlarmDev dotfield is set to 1 if any of the tags within the group are in an active alarm state.

Category
Alarms

Usage
TagName.AlarmDev

Parameter
TagName
Any integer, real, indirect analog tag, or alarm group.

Data Type
Discrete (read-only)

Valid Values
0 or 1

Example
The following statement verifies if Tag1 has an active deviation alarm associated with it:
IF (Tag1.AlarmDev == 1) THEN
The body of this IF-THEN statement is processed if there are active deviation alarms within the PumpStation alarm group.
IF (PumpStation.AlarmDev == 1) THEN
   MyAlarmMessage="The pumping station currently has an ALARM!";
ENDIF;
This dotfield is not linked to the .Ack or .UnAck dotfields. Therefore, even when an active alarm has been acknowledged, this dotfield remains equal to 1.

See Also

.AlarmROC Dotfield
Indicates when a rate-of-change alarm condition becomes active for the specified tag or alarm group. The default value is 0. When a rate-of-change alarm condition exists for the specified tag, it is set to a value of 1. The value remains 1 until the rate-of-change alarm condition no longer exists.

If the specified tag is the name of an alarm group, the .AlarmROC dotfield is set to 1 if any of the tags within the group are in a rate-of-change alarm state.

Category
Alarms

Usage
TagName.AlarmROC
Parameter

TagName
Any integer, real, indirect analog tag, or alarm group.

Data Type
Discrete (read-only)

Valid Values
0 or 1

Example
The following statement verifies if Tag1 has an active rate-of-change alarm associated with it:

```
IF (Tag1.AlarmROC == 1) THEN
```

The body of this IF-THEN statement would be processed if there were active rate-of-change alarms within the alarm group named PumpStation.

```
IF (PumpStation.AlarmROC == 1) THEN
    MyAlarmMessage="The pumping station currently has an ALARM!";
ENDIF;
```

This dotfield is not linked to the .Ack or .UnAck dotfield. Therefore, even when an active rate-of-change alarm has been acknowledged, this dotfield remains equal to 1.

See Also
.

.LoStatus Dotfield

Indicates when a Low alarm condition becomes active for the specified tag or alarm group. The default value is 0. When a Low alarm condition exists for the specified tag, it is set to a value of 1. The value remains 1 until the Low alarm condition no longer exists.

This dotfield is often used in conjunction with the .Alarm and .Ack dotfields to determine the specific alarm state of a particular tag.

Category
Alarms

Usage

```
TagName.LoStatus
```

Parameter

TagName
Any integer, real, or indirect analog tag.

Data Type
Discrete (read-only)

Valid Values
0 or 1

Example
The following IF-THEN runs when the .LoStatus (low alarm condition) for the MyTag tag is equal to 1.

```
IF (MyTag.LoStatus == 1) THEN
    OperatorMessage="MyTag has gone into Low Alarm";
ENDIF;
```
See Also

.LoLoStatus Dotfield
Indicates when a LoLo alarm condition becomes active for the specified tag or alarm group. The default value is 0. When a LoLo alarm condition exists for the specified tag, it is set to a value of 1. The value remains 1 until the LoLo alarm condition no longer exists.

This dotfield is often used in conjunction with the .Alarm and .Ack dotfields to determine the exact nature of the alarm status of a particular tag within the system.

Category
Alarms

Usage
TagName.LoLoStatus

Parameter
TagName
Any integer, real, or indirect analog tag.

Data Type
Discrete (read-only)

Valid Values
0 or 1

Example
The following IF-THEN statement runs when the .LoLoStatus (LoLo alarm limit) for the MyTag tag is equal to 1.

IF (MyTag.LoLoStatus == 1) THEN
    OperatorMessage="MyTag has gone into LoLo Alarm";
ENDIF;

See Also

.HiStatus Dotfield
Indicates when a High alarm condition becomes active for the specified tag or alarm group. The default value is 0. When a High alarm condition exists for the specified tag, it is set to a value of 1. The value remains 1 until the High alarm condition no longer exists.

This dotfield is often used in conjunction with the .Alarm and .Ack dotfields to determine the specific alarm state of a tag.

Category
Alarms

Usage
TagName.HiStatus
Parameter

TagName
Any integer, real, or indirect analog tag.

Data Type
Discrete (read-only)

Valid Values
0 or 1

Example
This script calls another script to stop a pump motor output if the MotorAmps tag goes into high limit alarm status.

```
IF (MotorAmps.HiStatus == 1) THEN
  CALL PumpShutdown( );
ENDIF;
```

See Also

.HiHiStatus Dotfield

Indicates when a HiHi alarm condition becomes active for the specified tag or alarm group. The default value is 0. When a HiHi alarm condition exists for the specified tag, it is set to a value of 1. The value remains 1 until the HiHi alarm condition no longer exists.

This dotfield is often used in conjunction with the .Alarm and .Ack dotfields to determine the specific alarm state of a tag.

Category
Alarms

Usage
TagName.HiHiStatus

Parameter

TagName
Any integer, real, or indirect analog tag.

Data Type
Discrete (read-only)

Valid Values
0 or 1

Example
The following IF-THEN statement runs when the .HiHiStatus (HiHi alarm) for the MyTag tag is 1.

```
IF (MyTag.HiHiStatus == 1) THEN
  OperatorMessage="MyTag has gone into HiHi Alarm";
ENDIF;
```

See Also
### .MinorDevStatus Dotfield

Indicates when a minor deviation alarm becomes active for the specified tag or alarm group. The default value is 0. When a minor deviation alarm condition exists for the specified tag, it is set to a value of 1. The value remains 1 until the minor deviation alarm condition no longer exists.

This dotfield is often used in conjunction with the .Alarm and .Ack dotfields to determine the specific alarm state of a tag.

**Category**
- Alarms

**Usage**

```plaintext
TagName.MinorDevStatus
```

**Parameter**

- `TagName`
  - Any integer, real, or indirect analog tag.

**Data Type**
- Discrete (read-only)

**Valid Values**

- 0 or 1

**Example**

The following IF-THEN statement runs when the .MinorDevStatus (minor deviation alarm) for the tag MyTag is equal to 1.

```plaintext
IF (MyTag.MinorDevStatus == 1) THEN
  OperatorMessage="MyTag has gone into a Minor Deviation Alarm";
ENDIF;
```

**See Also**

### .MajorDevStatus Dotfield

Indicates when a major deviation alarm becomes active for the specified tag or alarm group. The default value is 0. When a major deviation alarm condition exists, the specified dotfield is set to 1. The value remains 1 until the major deviation alarm condition no longer exists.

This dotfield is often used in conjunction with the .Alarm and .Ack dotfields to determine the specific alarm state of a tag.

**Category**
- Alarms

**Usage**

```plaintext
TagName.MajorDevStatus
```

**Parameter**

- `TagName`
  - Any integer, real, or indirect analog tag.

**Data Type**
- Discrete (read-only)
Valid Values
0 or 1

Example
The following IF-THEN statement runs when the .MajorDevStatus (Major deviation alarm) for the MyTag tag is equal to 1.

```
IF (MyTag.MajorDevStatus == 1) THEN
  OperatorMessage="MyTag has gone into a Major Deviation Alarm";
ENDIF;
```

See Also

.ROCStatus Dotfield
Indicates when a rate-of-change alarm becomes active for the specified tag or alarm group. The default value is 0. When a rate-of-change alarm condition exists for the specified tag, it is set to a value of 1. The value remains 1 until the rate-of-change alarm condition no longer exists.

This dotfield is often used in conjunction with the .Alarm and .Ack dotfields to determine the specific alarm state of a tag.

Category
Alarms

Usage
```
TagName.ROCStatus
```

Parameter
```
TagName
Any integer, real, or indirect analog tag.
```

Data Type
Discrete (read-only)

Valid Values
0 or 1

Example
The following IF-THEN statement runs when the .ROCStatus (rate-of-change alarm) for the MyTag tag is equal to 1.

```
IF (MyTag.ROCStatus == 1) THEN
  OperatorMessage="MyTag has gone into a Rate-Of-Change alarm";
ENDIF;
```

.ROCPct, .ROCSet

Reverting Alarm Status Handling to InTouch 7.1 Behavior
For InTouch 7.11 and later, the default behavior when a HiHi, LoLo, MinDev, or MajDev alarm occurs is to reset the In Alarm, ACK, and $NewAlarm status of Hi, Lo, MajDev, or MinDev alarms, respectively. For InTouch 7.1 and older versions, these alarm statuses were not affected by the occurrence of a HiHi, LoLo, MinDev, or MajDev alarm.
To support legacy applications that expect Hi, Lo, MajDev, or MinDev alarms to maintain their In Alarm, ACK, and $NewAlarm status despite the occurrence of the other alarms, the InTouch.ini file can include an IT71StatusFlag parameter.

To force the alarm handling to operate as it did in InTouch 7.1 and older versions

- Enter the following line in the InTouch.ini file:
  ```
  IT71StatusFlags=1
  ```

To change the alarm handling back to the default operation for InTouch 7.11 and later

- Enter the following line in the InTouch.ini file:
  ```
  IT71StatusFlags=0
  ```

For more information about how to edit the InTouch.ini file to configure this and other InTouch operating parameters, see the InTouch HMI Application Management and Extension Guide.

Determining if Alarm Limits Are Set for Tags

The following dotfields indicate whether alarm limits are set for a tag while an application is running.

- `.LoLoSet Dotfield` on page 107
- `.LoSet Dotfield` on page 108
- `.HiSet Dotfield` on page 108
- `.HiHiSet Dotfield` on page 109
- `.MinorDevSet Dotfield` on page 109
- `.MajorDevSet Dotfield` on page 110
- `.ROCSet Dotfield` on page 110

`.LoLoSet Dotfield`

Indicates whether a LoLo alarm limit has been set for an integer or real tag.

**Category**

Alarms

**Usage**

(TagName).LoLoSet

**Parameter**

TagName

Any integer, real, or indirect analog tag.

**Data Type**

Discrete (read-only)

**Valid Values**

0 or 1

**Example**

The THEN block executes if the LoLo alarm limit is set for the MyTag tag:

```
IF (MyTag.LoLoSet== 1) THEN
    MsgTag="LoLo alarm limit has been set for MyTag"
ENDIF;
```
See Also

.LoSet Dotfield
Indicates whether a Low alarm limit has been set for an integer or real tag.

Category
Alarms

Usage
TagName.LoSet

Parameter
TagName
Any integer, real, or indirect analog tag.

Data Type
Discrete (read-only)

Valid Values
0 or 1

Example
The THEN block executes if the Low alarm limit is set for the MyTag tag:
IF (MyTag.LoSet== 1) THEN
   MsgTag="Low alarm limit has been set for MyTag";
ENDIF;

See Also

.HiSet Dotfield
Indicates whether a High alarm limit has been set for an integer or real tag.

Category
Alarms

Usage
TagName.HiSet

Parameter
TagName
Any integer, real, or indirect analog tag.

Data Type
Discrete (read-only)

Valid Values
0 or 1

Example
The THEN block executes if the High alarm limit is set for the MyTag tag:
Controlling Alarm Properties of Tags and Groups at Run Time

InTouch HMI Alarms and Events Guide

IF (MyTag.HiSet== 1) THEN
    MsgTag="High alarm limit has been set for MyTag";
ENDIF;

See Also

.HiHiSet Dotfield
Indicates whether a HiHi alarm limit has been set for an integer or real tag.

Category
Alarms

Usage
TagName.HiHiSet

Parameter
TagName
Any integer, real, or indirect analog tag.

Data Type
Discrete (read-only)

Valid Values
0 or 1

Example
The THEN block executes if the HiHi alarm limit is set for the MyTag tag:
IF (MyTag.HiHiSet== 1) THEN
    MsgTag="HiHi alarm limit has been set for MyTag";
ENDIF;

See Also

.MinorDevSet Dotfield
Indicates whether a minor deviation alarm limit has been set for an integer or real tag.

Category
Alarms

Usage
TagName.MinorDevSet

Parameter
TagName
Any integer, real, or indirect analog tag.

Data Type
Discrete (read-only)

Valid Values
0 or 1
Example

The THEN block executes if the minor deviation percentage alarm limit is set for the MyTag tag:

```plaintext
IF (MyTag.MinorDevSet== 1) THEN
    MsgTag="Minor deviation alarm limit has been set for MyTag";
ENDIF;
```

See Also

**.MajorDevSet Dotfield**

Indicates whether a major deviation alarm limit has been set for an integer or real tag.

**Category**

Alarms

**Usage**

`TagName.MajorDevSet`

**Parameter**

`TagName`

Any integer, real, or indirect analog tag.

**Data Type**

Discrete (read-only)

**Valid Values**

0 or 1

**Example**

The THEN block executes if the major deviation percentage alarm limit is set for the MyTag tag:

```plaintext
IF (MyTag.MajorDevSet== 1) THEN
    MsgTag="Major deviation alarm limit has been set for MyTag";
ENDIF;
```

See Also

**.ROCSet Dotfield**

Indicates whether a rate-of-change alarm limit has been set for an integer or real tag.

**Category**

Alarms

**Usage**

`TagName.ROCSet`

**Parameter**

`TagName`

Any integer, real, or indirect analog tag.

**Data Type**

Discrete (read-only)
Valid Values
0 or 1

Example
The THEN block executes if the rate-of-change alarm limit is set for the MyTag tag:

```plaintext
IF (MyTag.ROCSet == 1) THEN
  MsgTag="Rate-of-change alarm limit has been set for MyTag";
ENDIF;
```

Enabling and Disabling Alarms for a Tag or Alarm Group

The InTouch HMI provides a set of dotfields that can enable or disable alarms that are set for a tag while an application is running.

Enabling/Disabling All Alarms

The .AlarmEnabled and .AlarmDisabled dotfields enable or disable alarms for a tag or alarm group based upon their respective values. The alarm states associated with both dotfields are the inverse of each other. In the case of .AlarmEnabled, a value of 1 enables alarms for a tag or alarm group. An .AlarmDisabled value of 1 disables alarms for a tag or alarm group.

When either dotfield enables alarms for an alarm group, all tags that belong to the group have alarming enabled. When either dotfield disables alarms, all events and alarms are ignored. The alarms are not stored in alarm memory, nor are they written to disk.

.AlarmEnabled Dotfield

Enables or disables alarms for a tag or an alarm group.

Category
Alarms

Usage
TagName.AlarmEnabled

Parameter
TagName
Any discrete, integer, real, indirect discrete, indirect analog tag, or alarm group.

Remarks
When .AlarmEnabled is set to 0, all events and alarms are ignored. They are not stored in alarm memory, nor are they written to disk. It is very important to re-enable events/alarms, whenever possible, to avoid data loss.

When the specified tag is an alarm group, all alarms associated with the tags within the specified alarm group are enabled.

Data Type
Discrete (read/write)

Valid Values
0 = Disable alarms
Controlling Alarm Properties of Tags and Groups at Run Time

1 = Enable alarms (default)

Example

The following example disables the alarms of the Tag1 tag:

Tag1.AlarmEnabled=0;

See Also

.AlarmDisabled

.AlarmDisabled Dotfield

Enables or disables alarms for a tag or an alarm group.

Category

Alarms

Usage

TagName.AlarmDisabled

Parameter

TagName

Any discrete, integer, real, indirect discrete, indirect analog tag, or alarm group.

Remarks

When .AlarmDisabled is set to 1, all events and alarms are ignored. They are not stored in alarm memory, nor are they written to disk. It is very important to re-enable events/alarms, whenever possible, to avoid data loss.

When the specified tag is an alarm group, all alarms associated with the tags within the specified alarm group are disabled.

This is the opposite of the .AlarmEnabled dotfield.

Example

The following example enables the alarms of the Tag1 tag.

Tag1.AlarmDisabled=0;

See Also

.AlarmEnabled

Enabling/Disabling LoLo Alarms

The .AlarmLoLoEnabled and .AlarmLoLoDisabled dotfields enable or disable LoLo alarms for a tag or alarm group based upon their respective values. The LoLo alarm states associated with both dotfields are the inverse of each other. In the case of .AlarmLoLoEnabled, a value of 1 enables LoLo alarms for a tag or alarm group. An .AlarmLoLoDisabled value of 1 disables LoLo alarms for a tag or alarm group.

When either dotfield enables LoLo alarms for an alarm group, all tags that belong to the group have LoLo alarms enabled. When either dotfield disables LoLo alarms, all LoLo alarms are ignored. The alarms are not stored in alarm memory, nor are they written to disk.

.AlarmLoLoEnabled Dotfield

Enables or disables LoLo condition events and alarms.

Category

Alarms
Usage

**TagName.AlarmLoLoEnabled**

Parameter

TagName

Any integer, real, indirect analog tag, or alarm group.

Remarks

When .AlarmLoLoEnabled is set to 0, all LoLo condition events and alarms are ignored. They are not stored in alarm memory, nor are they written to disk. It is very important to re-enable events/alarms, whenever possible, to avoid data loss.

Data Type

Discrete (read/write)

Valid Values

0 = Disable alarms

1 = Enable alarms (default)

Example

The following example disables the LoLo alarms of the Tag1 tag:

```
Tag1.AlarmLoLoEnabled=0;
```

See Also

**.AlarmLoLoDisabled Dotfield**

Enables or disables LoLo condition events and alarms.

Category

Alarms

Usage

**TagName.AlarmLoLoDisabled**

Parameter

TagName

Any integer, real, indirect analog tag, or alarm group.

Remarks

When .AlarmLoLoDisabled is set to 1, all LoLo condition events and alarms are ignored. They are not stored in alarm memory, nor are they written to disk. It is very important to re-enable events/alarms, whenever possible, to avoid data loss.

Data Type

Discrete (read/write)

Valid Values

1 = Disable alarms

0 = Enable alarms (default)

Example

The following example enables LoLo alarms of the Tag2 tag:
Tag2.AlarmLoLoDisabled=0;

See Also

### Enabling/Disabling Low Alarms

The `AlarmLoEnabled` and `AlarmLoDisabled` dotfields enable or disable Low alarms for a tag or alarm group based upon their respective values. The Low alarm states associated with both dotfields are the inverse of each other. In the case of `AlarmLoEnabled`, a value of 1 enables Low alarms for a tag or alarm group. An `AlarmLoDisabled` value of 1 disables Low alarms for a tag or alarm group.

When either dotfield enables Low alarms for an alarm group, all tags that belong to the group have Low alarms enabled. When either dotfield disables Low alarms, all Low alarms are ignored. The alarms are not stored in alarm memory, nor are they written to disk.

#### .AlarmLoEnabled Dotfield

Enables or disables Low condition events and alarms.

**Category**
Alarms

**Usage**
Tagname.AlarmLoEnabled

**Parameter**
Tagname

Any integer, real, indirect analog tag, or alarm group.

**Remarks**

When .AlarmLoEnabled is set to 0, all Low condition events and alarms are ignored. They are not stored in alarm memory, nor are they written to disk. It is very important to re-enable events/alarms, whenever possible, to avoid data loss.

**Data Type**
Discrete (read/write)

**Valid Values**

0 = Disable alarms
1 = Enable alarms (default)

**Example**

The following example disables the Low alarms of the Tag1 tag:

Tag1.AlarmLoEnabled=0;

See Also

#### .AlarmLoDisabled Dotfield

Enables or disables Low condition events and alarms.

**Category**
Alarms
Usage

`TagName.AlarmLoDisabled`

Parameter

- `TagName`
- Any integer, real, indirect analog tag, or alarm group.

Remarks

When `.AlarmLoDisabled` is set to 1, all Low condition events and alarms are ignored. They are not stored in alarm memory, nor are they written to disk. It is very important to re-enable events/alarms, whenever possible, to avoid data loss.

Data Type

Discrete (read/write)

Valid Values

- 1 = Disable alarms
- 0 = Enable alarms (default)

Example

The following example enables Low alarms of the Tag2 tag:

```
Tag2.AlarmLoDisabled=0;
```

See Also

- `.AlarmDisabled`
- `.AlarmEnabled`
- `.AlarmLoEnabled`

Enabling/Disabling High Alarms

The `.AlarmHiEnabled` and `.AlarmHiDisabled` dotfields enable or disable High alarms for a tag or alarm group based upon their respective values. The High alarm states associated with both dotfields are the inverse of each other. In the case of `.AlarmHiEnabled`, a value of 1 enables High alarms for a tag or alarm group. An `.AlarmHiDisabled` value of 1 disables High alarms for a tag or alarm group.

When either dotfield enables High alarms for an alarm group, all tags that belong to the group have High alarms enabled. When either dotfield disables High alarms, all High alarms are ignored. The High alarms are not stored in alarm memory, nor are they written to disk.

`.AlarmHiEnabled` Dotfield

Enables or disables High condition events and alarms.

Category

Alarms

Usage

`TagName.AlarmHiEnabled`

Parameter

- `TagName`
- Any integer, real, indirect analog tag, or alarm group.

Remarks

When `.AlarmHiEnabled` is set to 0, all High condition events and alarms are ignored. They are not stored in alarm memory, nor are they written to disk. It is very important to re-enable events/alarms, whenever possible, to avoid data loss.
This is the opposite of the .AlarmHiDisabled dotfield.

**Data Type**

Discrete (read/write)

**Valid Values**

0 = Disable alarms

1 = Enable alarms (default)

**Example**

The following example disables the High alarms of the tag Tag1:

```plaintext
Tag1.AlarmHiEnabled=0;
```

**See Also**

.AlarmHiDisabled, .AlarmEnabled

### .AlarmHiDisabled Dotfield

Enables or disables High condition events and alarms.

**Category**

Alarms

**Usage**

```
TagName.AlarmHiDisabled
```

**Parameter**

TagName

Any integer, real, indirect analog tag, or alarm group.

**Remarks**

When .AlarmHiDisabled is set to 1, all High condition events and alarms are ignored. They are not stored in alarm memory, nor are they written to disk. It is very important to re-enable events/alarms, whenever possible, to avoid data loss.

This is the opposite of the .AlarmHiEnabled dotfield.

**Data Type**

Discrete (read/write)

**Valid Values**

1 = Disable alarms

0 = Enable alarms (default)

**Example**

The following example enables High alarms of the Tag2 tag:

```plaintext
Tag2.AlarmHiDisabled=0;
```

**See Also**

.AlarmHiEnabled, .AlarmDisabled
Enabling/Disabling HiHi Alarms

The `.AlarmHiHiEnabled` and `.AlarmHiHiDisabled` dotfields enable or disable HiHi alarms for a tag or alarm group based upon their respective values. The HiHi alarm states associated with both dotfields are the inverse of each other. In the case of `.AlarmHiHiEnabled`, a value of 1 enables HiHi alarms for a tag or alarm group. An `.AlarmHiHiDisabled` value of 1 disables HiHi alarms for a tag or alarm group.

When either dotfield enables HiHi alarms for an alarm group, all tags that belong to the group have HiHi alarms enabled. When either dotfield disables HiHi alarms, all HiHi alarms are ignored. The HiHi alarms are not stored in alarm memory, nor are they written to disk.

`.AlarmHiHiEnabled` Dotfield

Enables and/or disables HiHi condition events and alarms.

**Category**
Alarms

**Usage**
```
TagName.AlarmHiHiEnabled
```

**Parameter**

- TagName
  - Any integer, real, indirect analog tag, or alarm group.

**Remarks**

When `.AlarmHiHiEnabled` is set to 0, all HiHi condition events and alarms are ignored. They are not stored in alarm memory, nor are they written to disk. It is very important to re-enable events/alarms, whenever possible, to avoid data loss.

**Data Type**
Discrete (read/write)

**Valid Values**

- 0 = Disable alarms
- 1 = Enable alarms (default)

**Example**

The following example disables the HiHi alarms of the Tag1 tag:
```
Tag1.AlarmHiHiEnabled=0;
```

**See Also**

`.AlarmHiHiDisabled`, `.AlarmEnabled`

`.AlarmHiHiDisabled` Dotfield

Enables or disables HiHi condition events and alarms.

**Category**
Alarms

**Usage**
```
TagName.AlarmHiHiDisabled
```

This page contains the text content.
Parameter

TagName
Any integer, real, indirect analog tag, or alarm group.

Remarks

When .AlarmHiHiDisabled is set to 1, all HiHi condition events and alarms are ignored. They are not stored in alarm memory, nor are they written to disk. It is very important to re-enable events/alarms, whenever possible, to avoid data loss.

This is the opposite of the .AlarmHiHiEnabled dotfield.

Data Type

Discrete (read/write)

Valid Values

1 = Disable alarms
0 = Enable alarms (default)

Example

The following example enables HiHi alarms of the Tag2 tag:

Tag2.AlarmHiHiDisabled=0;

See Also

.AlarmHiHiEnabled, .AlarmDisabled

Enabling/Disabling Discrete Alarms

The .AlarmDscEnabled and .AlarmDscDisabled dotfields enable or disable discrete alarms for a tag or alarm group based upon their respective values. The discrete alarm states associated with both dotfields are the inverse of each other. In the case of .AlarmDscEnabled, a value of 1 enables discrete alarms for a tag or alarm group. An .AlarmDscDisabled value of 1 disables discrete alarms for a tag or alarm group.

When either dotfield enables discrete alarms for an alarm group, all tags that belong to the group have discrete alarms enabled. When either dotfield disables discrete alarms, all discrete alarms are ignored. The discrete alarms are not stored in alarm memory, nor are they written to disk.

.AlarmDscEnabled Dotfield

Indicates whether or not the tag can generate discrete alarms.

Category

Alarms

Usage

TagName.AlarmDscEnabled

Parameter

TagName
Any discrete or indirect discrete tag or alarm group.

Remarks

When .AlarmDscEnabled is set to 0, all discrete condition alarms and events are ignored. They are not stored in alarm memory, nor are they written to a disk. It is very important to re-enable events/alarms, whenever possible, to avoid data loss.
Controlling Alarm Properties of Tags and Groups at Run Time

InTouch HMI Alarms and Events Guide

This is the opposite of the .AlarmDscDisabled dotfield.

**Data Type**
Discrete (read/write)

**Valid Values**
0 = Disable alarms
1 = Enable alarms (default)

**Example**
The following example disables the discrete alarms of the Tag1 tag:

```
Tag1.AlarmDscEnabled=0;
```

**See Also**
.AlarmDscDisabled

**.AlarmDscDisabled Dotfield**
Indicates whether or not the tag can generate discrete alarms.

**Category**
Alarms

**Usage**

```
TagName.AlarmDscDisabled
```

**Parameter**

TagName
Any discrete or indirect discrete tag or alarm group.

**Remarks**
When .AlarmDscDisabled is set to 1, all discrete condition alarms and events are ignored. They are not stored in alarm memory, nor are they written to a disk. It is very important to re-enable events/alarms, whenever possible, to avoid data loss.

This is the opposite of the .AlarmDscEnabled dotfield.

**Data Type**
Discrete (read/write)

**Valid Values**
1 = Disable alarms
0 = Enable alarms (default)

**Example**
The following example enables discrete alarms of the Tag2 tag:

```
Tag2.AlarmDscDisabled=0;
```

**Enabling/Disabling Minor Deviation Alarms**

The .AlarmMinDevEnabled and .AlarmMinDevDisabled dotfields enable or disable minor deviation alarms for a tag or alarm group based upon their respective values. The minor deviation alarm states associated with both dotfields are the inverse of each other. In the case of .AlarmMinDevEnabled, a value of 1 enables minor deviation alarms for a tag or alarm group. An .AlarmMinDevDisabled value of 1 disables minor deviation alarms for a tag or alarm group.
When either dotfield enables minor deviation alarms for an alarm group, all tags that belong to the group have minor deviation alarms enabled. When either dotfield disables minor deviation alarms, all minor deviation alarms are ignored. The minor deviation alarms are not stored in alarm memory, nor are they written to disk.

.AlarmMinDevEnabled Dotfield

Enables or disables minor deviation events and alarms.

**Category**
Alarms

**Usage**
tagName.AlarmMinDevEnabled

**Parameter**

TagName

Any integer, real, indirect analog tag, or alarm group.

**Remarks**
When .AlarmMinDevEnabled is set to 0, all minor deviation events and alarms are ignored. They are not stored in alarm memory, nor are they written to disk. It is very important to re-enable events/alarms, whenever possible, to avoid data loss.

**Data Type**
Discrete (read/write)

**Valid Values**

0 = Disable alarms
1 = Enable alarms (default)

**Example**
The following example disables the minor deviation alarms of the Tag1 tag:

Tag1.AlarmMinDevEnabled=0;

**See Also**

.AlarmMinDevDisabled Dotfield

Enables or disables minor deviation events and alarms.

**Category**
Alarms

**Usage**
tagName.AlarmMinDevDisabled

**Parameter**

TagName

Any integer, real, or indirect analog tag, or alarm group.

**Remarks**
When .AlarmMinDevDisabled is set to 1, all minor deviation events and alarms are ignored. They are not stored in alarm memory, nor are they written to disk. It is very important to re-enable events/alarms, whenever possible, to avoid data loss.
This is the opposite of the `.AlarmMinDevEnabled` dotfield.

**Data Type**
Discrete (read/write)

**Valid Values**
- 1 = Disable alarms
- 0 = Enable alarms (default)

**Example**
The following example enables minor deviation alarms of the Tag2 tag:
```
Tag2.AlarmMinDevDisabled=0;
```

**See Also**

### Enabling/Disabling Major Deviation Alarms

The `.AlarmMajDevEnabled` and `.AlarmMajDevDisabled` dotfields enable or disable major deviation alarms for a tag or alarm group based upon their respective values. The major deviation alarm states associated with both dotfields are the inverse of each other. In the case of `.AlarmMajDevEnabled`, a value of 1 enables major deviation alarms for a tag or alarm group. An `.AlarmMajDevDisabled` value of 1 disables major deviation alarms for a tag or alarm group.

When either dotfield enables major deviation alarms for an alarm group, all tags that belong to the group have major deviation alarms enabled. When either dotfield disables major deviation alarms, all major deviation alarms are ignored. The major deviation alarms are not stored in alarm memory, nor are they written to disk.

#### `.AlarmMajDevEnabled` Dotfield

Enables or disables major deviation events and alarms.

**Category**
Alarms

**Usage**
```
TagName.AlarmMajDevEnabled
```

**Parameter**
- **TagName**
  - Any integer, real, indirect analog tag, or alarm group.

**Remarks**
When `.AlarmMajDevEnabled` is set to 0, all major deviation events and alarms are ignored. They are not stored in alarm memory, nor are they written to disk. It is very important to re-enable events/alarms, whenever possible, to avoid data loss.

This is the opposite of the `.AlarmMajDevDisabled` dotfield.

**Data Type**
Discrete (read/write)

**Valid Values**
- 0 = Disable alarms
- 1 = Enable alarms (default)
Example
The following example disables major deviation alarms of the Tag1 tag:

```
Tag1.AlarmMajDevEnabled=0;
```

See Also

.AlarmMajDevDisabled Dotfield
Enables or disables major deviation events and alarms.

Category
Alarms

Usage
(TagName).AlarmMajDevDisabled

Parameter
TagName
Any integer, real, indirect analog tag, or alarm group.

Remarks
When .AlarmMajDevDisabled is set to 1, all major deviation events and alarms are ignored. They are not stored in alarm memory, nor are they written to disk. It is very important to re-enable events/alarms, whenever possible, to avoid data loss.

This is the opposite of the .AlarmMajDevEnabled dotfield.

Data Type
Discrete (read/write)

Valid Values
1 = Disable alarms
0 = Enable alarms (default)

Example
The following example enables major deviation alarms of the Tag2 tag:

```
Tag2.AlarmMajDevDisabled=0;
```

See Also

Enabling/Disabling Rate-Of-Change Alarms
The .AlarmROCEnabled and .AlarmROCDisabled dotfields enable or disable rate-of-change alarms for a tag or alarm group based upon their respective values. The rate-of-change alarm states associated with both dotfields are the inverse of each other. In the case of .AlarmROCEnabled, a value of 1 enables rate-of-change alarms for a tag or alarm group. An .AlarmROCDisabled value of 1 disables rate-of-change alarms for a tag or alarm group.

When either dotfield enables rate-of-change alarms for an alarm group, all tags that belong to the group have rate-of-change alarms enabled. When either dotfield disables rate-of-change alarms, all rate-of-change alarms are ignored. The rate-of-change alarms are not stored in alarm memory, nor are they written to disk.
.AlarmROCEnabled Dotfield

Enables or disables rate-of-change events and alarms.

**Category**
Alarms

**Usage**
(TagName).AlarmROCEnabled

**Parameter**
TagName
Any integer, real, indirect analog tag, or alarm group.

**Remarks**
When .AlarmROCEnabled is set to 0, all rate-of-change condition events and alarms are ignored. They are not stored in alarm memory, nor are they written to disk. It is very important to re-enable events/alarms, whenever possible, to avoid data loss.

This is the opposite of the .AlarmROCDisabled dotfield.

**Data Type**
Discrete (read/write)

**Valid Values**
0 = Disable alarms
1 = Enable alarms (default)

**Example**
The following example disables the rate-of-change alarms of the Tag1 tag:
(Tag1.AlarmROCEnabled=0;

**See Also**

.AlarmROCDisabled Dotfield

Disables or enables rate-of-change events and alarms.

**Category**
Alarms

**Usage**
(TagName).AlarmROCDisabled

**Parameter**
TagName
Any integer, real, indirect analog tag, or alarm group.

**Remarks**
When .AlarmROCDisabled is set to 1, all rate-of-change events and alarms are ignored. They are not stored in alarm memory, nor are they written to disk. It is very important to re-enable events/alarms, whenever possible, to avoid data loss.

This is the opposite of the .AlarmROCEnabled property.
Data Type
Discrete (read/write)

Valid Values
1 = Disable alarms
0 = Enable alarms (default)

Example
The following example enables rate-of-change alarms of the Tag2 tag:
Tag2.AlarmROCDisabled=0;

See Also

Changing a Tag's Alarm Limits
Use the following dotfields to change a tag's alarm limits while an application is running. You can change the limit for LoLo, Low, High, and HiHi alarms, the major and minor deviation percentage and target, and the rate-of-change deviation.

- .LoLoLimit Dotfield on page 124
- .LoLimit Dotfield on page 125
- .HiLimit Dotfield on page 125
- .HiHiLimit Dotfield on page 126
- .MinorDevPct Dotfield on page 126
- .MajorDevPct Dotfield on page 127
- .DevTarget Dotfield on page 128
- .ROCPct Dotfield on page 128

.LoLoLimit Dotfield
Changes a tag's LoLo alarm limit.

Category
Alarms

Usage
TagName.LoLoLimit

Parameter
TagName
Any integer, real, or indirect analog tag.

Remarks
If you want to continue to use the run-time value of this dotfield after an intentional or accidental shutdown of WindowViewer, select the Retentive Parameters option in the Tagname Dictionary.

Data Type
Analog (read/write)
Valid Values

Must be in value range configured for the specified tag.

Example

This statement decreases the LoLo alarm limit for the MyTag1 tag by a value of 10:

```
MyTag1.LoLoLimit=MyTag1.LoLoLimit - 10;
```

See Also

.LoLimit Dotfield

Changes a tag's Low alarm limit.

Category

Alarms

Usage

```
TagName.LoLimit
```

Parameter

TagName

Any integer, real, or indirect analog tag.

Remarks

If you want to continue to use the run-time value of this dotfield after an intentional or accidental shutdown of WindowViewer, select the Retentive Parameters option in the Tagname Dictionary.

Data Type

Analog (read/write)

Valid Values

Must be in value range configured for the specified tag.

Example

This statement decreases the Low alarm limit for the MyTag tag by a value of 10:

```
MyTag.LoLimit=MyTag.LoLimit - 10;
```

See Also

.HiLimit Dotfield

Changes a tag's High alarm limit.

Category

Alarms

Usage

```
TagName.HiLimit
```

Parameter

TagName

Any integer, real, or indirect analog tag.
Remarks
If you want to continue to use the run-time value of this dotfield after an intentional or accidental shutdown of WindowViewer, select the **Retentive Parameters** option in the Tagname Dictionary.

Data Type
Analog (read/write)

Valid Values
Must be in value range configured for the specified tag.

Example
This statement sets the High limit alarm for the **PumpTemp** tag to 212:

```
PumpTemp.HiLimit = 212;
```

See Also

**.HiHiLimit Dotfield**
Changes a tag's HiHi alarm limit.

Category
Alarms

Usage
```
TagName.HiHiLimit
```

Parameter
TagName
Any integer, real, or indirect analog tag.

Remarks
If you want to continue to use the run-time value of this dotfield after an intentional or accidental shutdown of WindowViewer, select the **Retentive Parameters** option in the Tagname Dictionary.

Data Type
Analog (read/write)

Valid Values
Must be in value range configured for the specified tag.

Example
The following statement increases the HiHi alarm limit for the **MyTag** tag by a value of 5:

```
MyTag.HiHiLimit = MyTag.HiHiLimit + 5;
```

See Also

**.MinorDevPct Dotfield**
Changes a tag's minor deviation alarm limit.
Controlling Alarm Properties of Tags and Groups at Run Time

Category
Alarms

Usage
(TagName).MinorDevPct

Parameter
Tag Name
Any integer, real, or indirect analog tag.

Remarks
If you want to continue to use the run-time value of this dotfield after an intentional or accidental shutdown of WindowViewer, select the Retentive Parameters option in the Tagname Dictionary.

Data Type
Real (read/write)

Valid Values
0 to 100

Example
The following statement sets the minor deviation limit property for the MyTag tag to 25 percent:
MyTag.MinorDevPct=25;

See Also
.MinorDevSet, .MinorDevStatus

.MajorDevPct Dotfield
Changes a tag’s major alarm deviation limit.

Category
Alarms

Usage
(TagName).MajorDevPct

Parameter
Tag Name
Any integer, real, or indirect analog tag.

Remarks
If you want to continue to use the run-time value of this dotfield after an intentional or accidental shutdown of WindowViewer, select the Retentive Parameters option in the Tagname Dictionary.

Data Type
Real (read/write)

Valid Values
0 to 100

Example
The following statement sets the major deviation limit property for the MyTag tag to 25 percent:
MyTag.MajorDevPct=25;
See Also

.DevTarget Dotfield

Changes the target for a tag's minor and major deviation alarms.

Category
Alarms

Usage

TagName.DevTarget

Parameter

TagName
Any integer, real, or indirect analog tag.

Remarks

If you want to continue to use the run-time value of this dotfield after an intentional or accidental shutdown of WindowViewer, select the Retentive Parameters option in the Tagname Dictionary.

Data Type
Real (read/write)

Valid Values
Must be in value range specified for the tag

Example

The following statement sets the deviation target for the MyTag tag to 500;

MyTag.DevTarget=500;

See Also

.ROCPct Dotfield

Changes a tag's rate-of-change alarm limit.

Category
Alarms

Usage

TagName.ROCPct

Parameter

TagName
Any integer, real, or indirect analog tag.

Remarks

The dotfield corresponds directly to the same field configured within the alarm section of the Tagname Dictionary.

Data Type
Integer (read/write)
Valid Values
0 to 100

Example
The following statement sets the rate-of-change alarm limit of the MyTag tag to 25 percent:
MyTag.ROCPct=25;

See Also
.ROCStatus, .ROCSets

Changing a Tag's Alarm Deadbands
Use the following dotfields to change a tag's alarm deadband range while an application is running:

- .AlarmValDeadband Dotfield on page 129
- .AlarmDevDeadband Dotfield on page 129

.AlarmValDeadband Dotfield
Changes a tag's deadband value while an InTouch application is running.

Category
Alarms

Usage
TagName.AlarmValDeadband

Parameter
TagName
Any integer, real, or indirect analog tag.

Remarks
If you want to continue to use the run-time value of this dotfield after an intentional or accidental shutdown of WindowViewer, select the Retentive Parameters option in the Tagname Dictionary.

Data Type
Analog (read/write)

Valid Values
Must be in value range specified for the tag

Example
The following statement changes the deadband for Tag1 tag to a value of 25:
Tag1.AlarmValDeadband=25;

See Also
.AlarmDevDeadband

.AlarmDevDeadband Dotfield
Changes a tag's deviation percentage deadband for both minor and major deviation alarms.

Category
Alarms

Controlling Alarm Properties of Tags and Groups at Run Time

InTouch HMI Alarms and Events Guide

130

Usage

TagName.AlarmDevDeadband

Parameter

TagName

Any integer, real, or indirect analog tag.

Remarks

If you want to continue to use the run-time value of this dotfield after an intentional or accidental shutdown of WindowViewer, select the Retentive Parameters option in the Tagname Dictionary.

Data Type

Integer (read/write)

Valid Values

0 to 100

Example

The following statement changes the deviation deadband percentage to 25 percent:

tag.AlarmDevDeadband=25;

See Also

.AlarmValDeadband, .AlarmDev

Changing the Alarm Comment Associated with a Tag

The .AlarmComment dotfield returns a comment text string that is associated with the alarm of a tag or alarm group.

.AlarmComment Dotfields

Returns a comment text string that is associated with the alarm of a tag or alarm group. By default, it is empty in a new application.

Associating User-Defined Information with an Alarm Instance

You can attach three items to an alarm record: two numbers and a string. Use the following dotfields to add information to an alarm record.

- .AlarmUserDefNumX Dotfields on page 130
- .AlarmUserDefStr Dotfield on page 131

.AlarmUserDefNumX Dotfields

To simplify setting user values, you can set these dotfields on an alarm group as well as on a specific tag. For example, InBatch could set the batch number in .AlarmUserDefNum1 all the way up at the $System alarm group, causing all alarms to have the batch number attached.

The .AlarmUserDefNum1 and .AlarmUserDefNum2 dotfields correspond to the User1 and User2 columns in the Alarm Viewer control, respectively.

If you set .AlarmUserDefNum1 on an alarm group, it applies to all alarms in that group and any of its sub-groups. You can also specifically set the value of .AlarmUserDefNum1 on a tag. In this case, it applies only to that tag and overwrites any setting of .AlarmUserDefNum1 in the tag’s alarm group.

Category

Alarms
Usage

<table>
<thead>
<tr>
<th>TagName.AlarmUserDefNum1</th>
</tr>
</thead>
<tbody>
<tr>
<td>TagName.AlarmUserDefNum2</td>
</tr>
</tbody>
</table>

Parameter

TagName

Any discrete, integer, real, indirect discrete, indirect analog tag, or alarm group.

Remarks

This user-defined dotfield is enabled for a wide range of tags, particularly discrete tags, analog tags, and alarm groups (whether or not they have alarms defined). You can leave these items unset, set all of them, or set only some of them for any individual tag, group, or parent group.

The value of this dotfield is attached to the alarm, but ONLY if a value has been set, for example, by a script or a POKE.

Data Types

Analog (read/write)

Valid Values

Any real value and not set (default)

Examples

The following examples use constant values. However, you can use InTouch QuickScripts to copy the value of another tag to any of these user-defined fields. You can also use PtAcc to set or inspect them, or use InTouch as an I/O Server to get or set the values.

```
$System.AlarmUserDefNum1 = 4;
GroupA.AlarmUserDefNum1 = 27649;
```

In concept, the lowest-level setting prevails, when an alarm notification is sent to the Distributed Alarm system. That is, if the tag has .AlarmUserDefNum1 set to some value, the alarm record should be populated using that setting. However, if the tag doesn't have one, WindowViewer checks if the tag's alarm group has one, and so on up the line until the root group $System is reached. If no setting is found at any level, the entry in the alarm record will be left empty (zero for numbers, an empty string for strings).

Note: This hierarchical search is handled independently for each item. Therefore, if a tag has a setting for .AlarmUserDefNum2 but not for .AlarmUserDefNum1, but its parent group has a setting for .AlarmUserDefNum1, the tag will inherit the setting for .AlarmUserDefNum1 from its parent group.

See Also

.AlarmUserDefStr

.AlarmUserDefStr Dotfield

The .AlarmUserDefStr dotfield is attached to the information recorded for each alarm by Alarm DB Logger in the alarm database. The .AlarmUserDefStr dotfield corresponds to database field User3. You can use the “user-defined” columns in a SELECT statement to select particular collections of alarms for database operations. For example, if $System.AlarmUserDefStr is set to a Batch String and is changed each time the Batch changes, a selection involving the database field User3 can be used to select alarms for particular batches.

Category

Alarms

Usage

Tagname.AlarmUserDefStr
Parameter

Tagname
Any discrete, integer, real, indirect discrete, or indirect analog tag, or alarm group.

Remarks
This user-defined dotfield is enabled for a wide range of tags, particularly discrete tags, analog tags, and alarm groups (whether or not they have alarms defined). You can leave these items unset, set all of them, or set only some of them for any individual tag, group, or parent group.

The value of this dotfield is attached to the alarm, but ONLY if a value has been set, for example, using a script or a POKE.

Data Type
Message (read/write)

Valid Values
NULL and any valid string

Examples
This example uses a constant value. However, you can use InTouch QuickScripts to copy the value of another tag to any of these user-defined fields. You can also use PtAcc to set or inspect them, or use InTouch as an I/O Server to get or set the values.

```plaintext
Tag04.AlarmUserDefStr = "Joe";
```

In concept, the lowest-level setting prevails, when an alarm notification is sent to the Distributed Alarm system. That is, if the tag has .AlarmUserDefStr set to some value, the alarm record should be populated using that setting. However, if the tag doesn't have one, WindowViewer will check if the tag's alarm group has one, and so on up the line until the root group $System is reached. If no setting is found at any level, the entry in the alarm record will be left empty (zero for numbers, an empty string for strings).

Also note that this hierarchical search is handled independently for each item. Therefore, if a tag has a setting for .AlarmUserDefNum1 but not for .AlarmUserDefStr, but its parent group has a setting for .AlarmUserDefStr, that setting is used in the alarm record.

See Also
.AlarmUserDefNumX

Determining the Inhibitor Tag of a Tag or Alarm Group

Use the following dotfields to determine the inhibitor tag of various types of alarms.

- `.AlarmDscInhibitor Dotfield` on page 132
- `.AlarmLoLoInhibitor Dotfield` on page 133
- `.AlarmLoInhibitor Dotfield` on page 134
- `.AlarmHiInhibitor Dotfield` on page 135
- `.AlarmHiHiInhibitor Dotfield` on page 135
- `.AlarmMinDevInhibitor Dotfield` on page 136
- `.AlarmMajDevInhibitor Dotfield` on page 136
- `.AlarmROCInhibitor Dotfield` on page 137

.AlarmDscInhibitor Dotfield

Returns the name of the inhibitor tag assigned to a discrete alarm.
Category
Alarms
Usage
TagName.AlarmDscInhibitor
Parameter
TagName
Any discrete tag or alarm group.
Remarks
Configured in WindowMaker. Cannot be changed during run time.
Data Types
Message (read-only)
Examples
The .AlarmDSCInhibitor dotfield is used by setting .Name to an Indirect tag that is equal to the value of the .AlarmDscInhibitor tag then manipulating the value of the Indirect tag.
The following statement returns the name of the alarm inhibitor tag for a discrete alarm (assuming SomeIndirectTag is an analog indirect tag):
SomeIndirectTag.Name = AlarmedTag.AlarmDscInhibitor;
The inhibition state of the alarmed tag can be controlled by setting the value of the indirect tag as follows:
SomeIndirectTag = 1;
Turns on inhibition. Discrete alarms are disabled for AlarmedTag
SomeIndirectTag = 0;
Turns off inhibition
Discrete alarms can be generated for AlarmedTag

.AlarmLoLoInhibitor Dotfield

Returns the name of the inhibitor tag assigned to a LoLo alarm.
Category
Alarms
Usage
TagName.AlarmLoLoInhibitor
Parameter
TagName
Any integer, real, indirect analog tag, or alarm group tag.
Remarks
Configured in WindowMaker. Cannot be changed during run time.
Data Types
Message (read-only)
Examples
The .AlarmLoLoInhibitor dotfield is used by setting .Name to an Indirect tag that is equal to the value of the .AlarmLoLoInhibitor tag then manipulating the value of the Indirect tag.
The following statement returns the name of the alarm inhibitor tag for a LoLo alarm limit (assuming SomeIndirectTag is an analog indirect tag):

```
SomeIndirectTag.Name = AlarmedTag.AlarmLoLoInhibitor;
```

The inhibition state of the alarmed tag can be controlled by setting the value of the Indirect tag as follows:

```
SomeIndirectTag = 1;
```

Turns on inhibition
LoLo alarms are disabled for AlarmedTag

```
SomeIndirectTag = 0;
```

Turns off inhibition
LoLo alarms can be generated for AlarmedTag

**See Also**
.AlarmHiInhibitor, .AlarmHiHiInhibitor, .AlarmLoInhibitor

### .AlarmLoInhibitor Dotfield

Returns the name of the inhibitor tag assigned to a Low alarm.

**Category**
Alarms

**Usage**

```
TagName.AlarmLoInhibitor
```

**Parameter**

TagName
Any integer, real, indirect analog tag, or alarm group tag.

**Remarks**
Configured in WindowMaker. Cannot be changed during run time.

**Data Types**
Message (read-only)

**Examples**
The .AlarmLoInhibitor dotfield is used by setting .Name to an Indirect tag that is equal to the value of the .AlarmLoInhibitor tag then manipulating the value of the Indirect tag.

The following statement returns the name of the alarm inhibitor tag for a Low alarm limit (assuming SomeIndirectTag is an analog indirect tag):

```
SomeIndirectTag.Name = AlarmedTag.AlarmLoInhibitor;
```

The inhibition state of the alarmed tag can be controlled by setting the value of the Indirect tag as follows:

```
SomeIndirectTag = 1;
```

Turns on inhibition
Low alarms are disabled for AlarmedTag

```
SomeIndirectTag = 0;
```

Turns off inhibition
Low alarms can be generated for AlarmedTag

**See Also**
.AlarmHiInhibitor, .AlarmHiHiInhibitor, .AlarmLoInhibitor
### .AlarmHiInhibitor Dotfield

Returns the name of the inhibitor tag assigned to a High alarm.

**Category**

Alarms

**Usage**

`TagName.AlarmHiInhibitor`

**Parameter**

- `TagName`
  - Any integer, real, indirect analog tag, or alarm group tag.

**Remarks**

Configured in WindowMaker. Cannot be changed during run time.

**Data Types**

Message (read-only)

**Example**

The `.AlarmHiInhibitor` dotfield is used by setting `.Name` to an Indirect tag that is equal to the value of the `.AlarmHiInhibitor` tag then manipulating the value of the Indirect tag.

The following statement returns the name of the alarm inhibitor tag for a High alarm limit (assuming `SomeIndirectTag` is an analog indirect tag):

```plaintext
SomeIndirectTag.Name = AlarmedTag.AlarmHiInhibitor;
```

The inhibition state of the alarmed tag can be controlled by setting the value of the Indirect tag as follows:

```plaintext
SomeIndirectTag = 1;
```

Turns on inhibition
High alarms are disabled for `AlarmedTag`

```plaintext
SomeIndirectTag = 0;
```

Turns off inhibition
High alarms can be generated for `AlarmedTag`

**See Also**

`.AlarmHiHiInhibitor`, `.AlarmLoInhibitor`, `.AlarmLoLoInhibitor`

### .AlarmHiHiInhibitor Dotfield

Returns the name of the inhibitor tag assigned to a HiHi alarm condition.

**Category**

Alarms

**Usage**

`TagName.AlarmHiHiInhibitor`

**Parameter**

- `TagName`
  - Any integer, real, indirect analog tag, or alarm group tag.

**Remarks**

Configured in WindowMaker. Cannot be changed during run time.
Data Types
Message (read-only)

Example
The .AlarmHiHiInhibitor dotfield is used by setting .Name to an Indirect tag that is equal to the value of the .AlarmHiHiInhibitor tag then manipulating the value of the Indirect tag. The following statement returns the name of the alarm inhibitor tag for a HiHi alarm limit (assuming SomeIndirectTag is an analog indirect tag):

SomeIndirectTag.Name = AlarmedTag.AlarmHiHiInhibitor;

The inhibition state of the alarmed tag can be controlled by setting the value of the indirect tag as follows:
SomeIndirectTag = 1;
Turns on inhibition
HiHi alarms are disabled for AlarmedTag
SomeIndirectTag = 0;
Turns off inhibition
HiHi alarms can be generated for AlarmedTag

See Also
.AlarmHiInhibitor, .AlarmLoInhibitor, .AlarmLoLoInhibitor

.AlarmMinDevInhibitor Dotfield
Returns the name of the alarm inhibitor tag associated with a minor deviation alarm condition.

Category
Alarms

Usage
TagName.AlarmMinDevInhibitor

Parameter
TagName
Any integer, real, indirect analog tag, or alarm group tag.

Remarks
Configured in WindowMaker. Cannot be changed during run time.

Data Types
Message (read-only)

Example
The .AlarmMinDevInhibitor dotfield is used by setting .Name to an Indirect tag that is equal to the value of the .AlarmMinDevInhibitor tag then manipulating the value of the Indirect tag. The following statement returns the name of the alarm inhibitor tag for a minor deviation alarm limit (assuming SomeIndirectTag is an analog indirect tag):

SomeIndirectTag.Name = AlarmedTag.AlarmMinDevInhibitor;

The inhibition state of the alarmed tag can be controlled by setting the value of the indirect tag as follows:
SomeIndirectTag = 1;
Turns on inhibition
Minor deviation alarms are disabled for AlarmedTag
SomeIndirectTag = 0;
Turns off inhibition
Minor deviation alarms can be generated for AlarmedTag
See Also
.AlarmMajDevInhibitor

.AlarmMajDevInhibitor Dotfield
Returns the name of the alarm inhibitor tag associated with a major deviation alarm condition.
Category
Alarms
Usage
(TagName.AlarmMajDevInhibitor

Parameter
TagName
   Any integer, real, indirect analog tag, or alarm group tag.

Data Types
Message (read-only)

Example
The .AlarmMajDevInhibitor dotfield is used by setting .Name to an Indirect tag that is equal to the value of the .AlarmMajDevInhibitor tag then manipulating the value of the Indirect tag. The following statement returns the name of the alarm inhibitor tag for a major deviation alarm limit (assuming SomeIndirectTag is an analog indirect tag):

SomeIndirectTag.Name = AlarmedTag.AlarmMajDevInhibitor;

The inhibition state of the alarmed tag can be controlled by setting the value of the Indirect tag as follows:

SomeIndirectTag = 1;

   Turns on inhibition
   Major deviation alarms are disabled for AlarmedTag

SomeIndirectTag = 0;

   Turns off inhibition
   Major deviation alarms can be generated for AlarmedTag

See Also
.AlarmMinDevInhibitor

.AlarmROCInhibitor Dotfield
Returns the name of the alarm inhibitor tag associated with a rate-of-change alarm condition.
Category
Alarms
Usage
(TagName.AlarmROCInhibitor

Parameter
TagName
   Any integer, real, indirect analog tag, or alarm group tag.

Data Types
Message (read-only)
Example

The .AlarmROCInhibitor dotfield is used by setting .Name to an Indirect tag that is equal to the value of the .AlarmROCInhibitor tag then manipulating the value of the Indirect tag. The following statement returns the name of the alarm inhibitor tag for a rate-of-change alarm limit (assuming SomeIndirectTag is an analog indirect tag):

```
SomeIndirectTag.Name = AlarmedTag.AlarmROCInhibitor;
```

The inhibition state of the alarmed tag can be controlled by setting the value of the Indirect tag as follows:

```
SomeIndirectTag = 1;
```

Turns on inhibition
Rate-of-change alarms are disabled for AlarmedTag

```
SomeIndirectTag = 0;
```

Turns off inhibition
Rate-of-change alarms can be generated for AlarmedTag

Counting the Number of Active or Unacknowledged Alarms

Use the following dotfields to find out the number of active or unacknowledged alarms while the application is running.

<table>
<thead>
<tr>
<th>Dotfield</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>.AlarmTotalCount</td>
<td>Counts the number of alarms associated with a tag or alarm group.</td>
</tr>
<tr>
<td>.AlarmUnAckCount</td>
<td>Counts the number of unacknowledged alarms associated with a tag or alarm group.</td>
</tr>
<tr>
<td>.AlarmValueCount</td>
<td>Counts the number of value alarms associated with a tag.</td>
</tr>

Controlling Alarm Properties of Tags and Groups at Run Time

InTouch HMI Alarms and Events Guide

Example
Tag1 is an analog tag configured for alarms. AUC is an analog tag, which gets the total number of unacknowledged alarms present in Tag1.

\[ AUC = \text{Tag1.AlarmUnAckCount}; \]

See Also

.AlarmValueCount Dotfield
Tracks the total number of active value alarms for a specified tag or alarm group.

Category
Alarms

Usage
\[ \text{TagName.AlarmValueCount} \]

Parameter
TagName
Any integer, real, indirect analog tag, or alarm group.

Remarks
This includes the count of HiHi, High, Low, and LoLo alarms. It includes both acknowledged and unacknowledged alarms. For non-expanded summary alarm tags, this count will not exceed 1. However, the count may vary with alarm groups.

Data Types
Integer (read-only)

Valid Values
0 or any positive integer

Example
Tag1 is an analog tag configured for value alarms. AVC is also an analog tag, which gets the total number of all alarm values present in Tag1.

\[ AVC = \text{Tag1.AlarmValueCount}; \]

See Also

.AlarmValueUnAckCount Dotfield
Tracks the total number of unacknowledged value alarms for a specified tag or alarm group. This includes the count of HiHi, High, Low, and LoLo alarms.

Category
Alarms

Usage
\[ \text{TagName.AlarmValueUnAckCount} \]
Parameter

TagName
Any integer, real, indirect analog tag, or alarm group.

Data Types

Integer (read-only)

Valid Values

0 or any positive integer

Example

Tag1 is an analog tag configured for value alarms. AVUC is also an analog tag, which gets the total number of all unacknowledged value alarms present in Tag1.

\[ AVUC = Tag1.AlarmValueUnAckCount; \]

See Also

.AlarmDscCount Dotfield

Tracks the total number of active discrete alarms for a specified tag or alarm group.

Category

Alarms

Usage

TagName.AlarmDscCount;

Parameter

TagName
Any discrete tag, indirect discrete tag, or alarm group.

Remarks

The count assigned to The \texttt{AlarmDscCount} dotfield includes both acknowledged and unacknowledged alarms. For non-expanded summary alarm tags, this count is always 1. However, the count can vary for alarm groups.

Data Types

Integer (read-only)

Valid Values

0 or any positive integer

Example

Tag1 is a discrete tag configured for discrete alarms. ADC is an analog tag, which gets the total number of active discrete alarms (both unacknowledged and acknowledged) present in Tag1.

\[ ADC = Tag1.AlarmDSCCount; \]

See Also

.AlarmDscUnAckCount Dotfield

Tracks the total number of unacknowledged discrete alarms for a specified tag or alarm group.

Category
Alarms

Usage
TagName.AlarmDscUnAckCount

Parameter

TagName
Any discrete tag, indirect discrete tag, or alarm group.

Data Types
Integer (read-only)

Valid Values
0 or any positive integer

Example
Tag1 is a discrete tag configured for discrete alarms. ADUC is an analog tag, which gets the total number of unacknowledged discrete alarms present in Tag1.
ADUC = Tag1.AlarmDscUnAckCount;

See Also

.AlarmDevCount Dotfield

Tracks the total number of active deviation alarms for a specified tag or alarm group.

Category
Alarms

Usage
TagName.AlarmDevCount

Parameter

TagName
Any real tag, integer tag, indirect analog tag, or alarm group.

Remarks
This includes the count of minor and major deviation alarms. It includes both acknowledged and unacknowledged alarms. For non-expanded summary alarm tags, this count is always 1. However, the count can vary with alarm groups.

Data Types
Analog (read-only)

Valid Values
0 or any positive integer
Example

Tag1 is an analog tag configured for Deviation alarms. ADC is also an analog tag, which gets the total number of active deviation (both unacknowledged and acknowledged) alarms present in Tag1.

\[
\text{ADC} = \text{Tag1.AlarmDevCount};
\]

See Also

.\text{AlarmDSCCount}, \cdot \text{AlarmValueCount}, \cdot \text{AlarmROCUnAckCount}, \cdot \text{AlarmTotalCount}, \cdot \text{AlarmDSCUAckCount}, \cdot \text{AlarmValueUnAckCount}, \cdot \text{AlarmDevUnAckCount}, \cdot \text{AlarmROCUnAckCount}, \cdot \text{AlarmUnAckCount}

.\text{AlarmDevUnAckCount Dotfield}

Tracks the total number of unacknowledged deviation alarms for a specified tag or alarm group. This includes the count of minor and major deviation alarms.

Category

Alarms

Usage

\[\text{TagName.AlarmDevUnAckCount}\]

Parameter

TagName

Any real tag, integer tag, indirect analog tag, or alarm group.

Data Types

Analog (read-only)

Valid Values

0 or any positive integer

Example

Tag1 is an analog tag configured for Deviation alarms. ADUC is also an analog tag, which gets the total number of unacknowledged deviation alarms present in Tag1.

\[
\text{ADUC} = \text{Tag1.AlarmDevUnAckCount};
\]

See Also

.\text{AlarmDevCount}, \cdot \text{AlarmDSCCount}, \cdot \text{AlarmValueCount}, \cdot \text{AlarmROCUnAckCount}, \cdot \text{AlarmTotalCount}, \cdot \text{AlarmDSCUAckCount}, \cdot \text{AlarmValueUnAckCount}, \cdot \text{AlarmDevUnAckCount}, \cdot \text{AlarmROCUnAckCount}, \cdot \text{AlarmUnAckCount}

.\text{AlarmROCCount Dotfield}

Tracks the total number of active rate-of-change alarms for a specified tag or alarm group. It includes both acknowledged and unacknowledged alarms. For non-expanded summary alarm tags, this count will always be 1. However, the count may vary with alarm groups.

Category

Alarms

Usage

\[\text{TagName.AlarmROCCount}\]

Parameter

TagName

Any real tag, integer tag, indirect analog tag, or alarm group.
Data Types
Integer (read-only)

Valid Values
0 or any positive integer

Example
Tag1 is an analog tag configured for rate-of-change alarms. ARC is also an analog tag, which gets the total number of active rate-of-change alarms (both unacknowledged and acknowledged) present in Tag1.

\[ ARC = Tag1.AlarmROCCount; \]

See Also

.AlarmROCUnAckCount Dotfield
Tracks the total number of unacknowledged rate-of-change alarms for a specified analog tag or alarm group.

Category
Alarms

Usage

**TagName.AlarmROCUnAckCount**

Parameter

TagName
Any real tag, integer tag, indirect analog tag, or alarm group.

Data Types
Integer (read-only)

Valid Values
0 or any positive integer

Example
Tag1 is an analog tag configured for rate-of-change alarms. ARUC is also an analog tag, which gets the total number of unacknowledged rate-of-change alarms present in Tag1.

\[ ARUC = Tag1.AlarmROCUnAckCount; \]

Using Alarm Tree Viewer Control ActiveX Events to Trigger Scripts ......................................................... 161

About Viewing Alarm Hierarchies

The Alarm Tree Viewer ActiveX control shows the alarm group hierarchy of alarm providers selected by an alarm query. Items that appear in the Alarm Tree Viewer control include alarm providers, nodes, and groups.

You can enhance the usability of the Alarm Viewer control by using an Alarm Tree Viewer control. You can create a script so that when the operator selects an alarm provider in the Alarm Tree Viewer control, the Alarm Viewer control queries the new alarm provider.

You can configure how the Alarm Tree Viewer control appears and what data is shown. For more information, see Configuring an Alarm Tree Viewer Control on page 146.

When you finish configuring the Alarm Tree Viewer control, you can modify the data you are viewing by:

- Sorting the data by name.
- Updating the tree.
- Performing another query.

For more information about ActiveX controls, see ActiveX Controls in the InTouch® HMI Visualization Guide.
Configuring an Alarm Tree Viewer Control

You can configure the following for the Alarm Tree Viewer control:

- General control appearance, including colors
- Text font
- Automatic refresh
- Which features users can access at run time
- Which providers and groups to show
- Custom saved queries
- Sort order for alarm groups

You can configure these options from within WindowMaker and while the Alarm Tree Viewer control is running.

Configuring the Appearance and Colors

When you configure the visual appearance of the Alarm Tree Viewer control, you can:

- Include a status bar.
- Include a column header.
- Set the colors of visual elements.

To configure the appearance

1. Right-click the Alarm Tree Viewer control, and then click Properties. The AlarmTreeViewerCtrl Properties dialog box appears.
2. Click the General tab.
3. Configure how the Alarm Tree Viewer control appears to run-time users. Do any of the following:
   - Select the Perform Query on Startup check box for the tree to automatically update using default query properties. Otherwise, users must run the Refresh command to update the tree.
   - Select the Show Context Sensitive Menu check box to activate the shortcut menu. Click Configure Context Menus to configure what commands appear on the menu. For more information, see Controlling Which Features Users Can Access at Run Time on page 305.
   - In the Display Mode list, click how you want the tree to refresh. For an automatic refresh, type the refresh interval the Auto Refresh Interval box. The range is 5 to 32767 seconds.
Viewing Alarm Hierarchies

InTouch HMI Alarms and Events Guide

- In the **Expansion Level box**, type the number of expansion levels for the tree. This determines to which alarm group branch level the alarm tree is opened when you manually refresh the control. A value of 1 shows only the provider, a value of 2 shows the direct alarm groups of the provider, and so on.

- Select the **Sort Elements in Alphabetical Order** check box to sort the tree elements in alphabetical order. Click either **Ascending** or **Descending** for the sort direction.

- Select the **Show Heading** check box to show a header above the hierarchy. In the box, type the header bar text.

- Select the **Show Status Bar** check box to show a status bar at the bottom of the Alarm Tree Viewer control.

- Click **Font** to configure the font properties for the tree. The standard Windows **Font** dialog box appears.

- Select the **Element Selection** check box to enable users to select an element in the tree.

- Select the **Allow Multiple Selections** check box to enable users to select one or more elements using the CTRL and SHIFT keys.

- Select the Silent Mode check box to prevent the Alarm Tree Viewer control from showing run-time error messages. Error messages are always sent to the Logger.

4. Click **Apply**.

5. Click the **Color** tab.

6. Click the palette button to assign colors to the visual elements of the Alarm Tree Viewer control.
   
   You can set the colors of the title bar text, window background, selected element text, and selected element background.

7. Click **Apply**.

**Configuring Fonts**

You can configure how the text appears for the Alarm Tree Viewer control.

**To configure the font**

1. Right-click the Alarm Tree Viewer control, and then click **Properties**. The AlarmTreeViewerCtrl **Properties** dialog box appears.
2. Click the General tab.

3. Click Font. The standard Windows Font dialog box appears. Configure the font and then click OK.
4. Click OK.

**Configuring Automatic Refresh**

You can configure the Alarm Tree Viewer control to refresh automatically at run time. Otherwise, the operator must refresh the Alarm Tree Viewer control manually.

**To configure automatic refresh**

1. Right-click the Alarm Tree Viewer control, and then click Properties. The AlarmTreeViewerCtrl Properties dialog box appears.
2. Click the General tab.
3. In the Display Mode list, click how you want the tree to refresh, either Manual Refresh or Auto Refresh. For an automatic refresh, type the tree refresh interval the Auto Refresh Interval box. The range is 5 to 32767 seconds.
4. Click Apply.

**Tuning the Alarm Tree View Refresh**

When the Alarm Tree View is being refreshed, it is possible that the alarm providers listed in the tree do not match the alarm providers that were included in the query. This can occur if remote alarm providers have very large hierarchies of alarm groups or if the network connection with the alarm providers is slow.

To ensure that the Alarm Tree View refreshes properly, there are three settings that can be entered and tuned in the [InTouch] section of the InTouch.ini file. These settings specify how long to wait for a complete response to the query and how frequently to retry the alarm query during that period.

These settings are not included in the InTouch.ini file by default and must be manually entered to tune them. When the settings are not explicitly entered in the InTouch.ini file, their default values are used.

**AlarmTreeFastRetryMax**

This setting determines how long immediately after a query was submitted that fast retries (1 per second) of the tree data retrieval will be performed. Values are in seconds.

- **Allowed values:** 1 to 32767
- **Default value:** 10

**Example:**

```ini
[InTouch]
AlarmTreeFastRetryMax=5
```
AlarmTreeSlowRetryInterval

Once the fast retries have been completed, this setting determines the frequency, in seconds, with which additional retries of the tree data retrieval will be performed.

- Allowed values: 1 to 32767
- Default value: 5

Example:

<table>
<thead>
<tr>
<th>InTouch</th>
</tr>
</thead>
<tbody>
<tr>
<td>AlarmTreeSlowRetryInterval=10</td>
</tr>
</tbody>
</table>

AlarmTreeTotalRetryMax

This setting specifies the maximum duration, in seconds, for which both types of retries will be performed.

- Allowed values: 1 to 32767
- Default value: 30

Example:

<table>
<thead>
<tr>
<th>InTouch</th>
</tr>
</thead>
<tbody>
<tr>
<td>AlarmTreeTotalRetryMax=60</td>
</tr>
</tbody>
</table>

Retry Behavior with the Default Settings

For example, using the default retry settings and the default maximum retry duration of 30 seconds:

1. During the fast retry interval, the retrieval will be retried for 10 seconds, once every second.
2. During the slow retry interval, the retrieval will be retried every 5 seconds for another 20 seconds.

When the Refresh Is Considered Complete

The display will continue retrying until:

- Connections are completed to all of the providers specified in the alarm query, and
- The hierarchy trees are shown for all the providers requested

The display refresh timers are reset to their modified or default values each time a query is submitted.

Managing Access to Features at Runtime

The Alarm Tree Viewer control includes a shortcut menu that operators can open by right-clicking on the control during run time. You can configure what commands appear on the menu.

To configure the run-time shortcut menu

1. Right-click the Alarm Tree Viewer control, and then click Properties. The AlarmTreeViewerCtrl Properties dialog box appears.
2. Click the General tab.
3. Select the Show Context Sensitive Menu check box to activate the shortcut menu.

![Context Sensitive Menus Dialog Box]

5. Select the check box for each command that you want to appear in the shortcut menu. You must select at least one shortcut command.

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Refresh</td>
<td>Refreshes the data shown in the Alarm Tree Viewer control.</td>
</tr>
<tr>
<td>Freeze</td>
<td>Allows you to toggle the freeze/unfreeze mode of the tree.</td>
</tr>
<tr>
<td>Query Favorites</td>
<td>Shows the Alarm Query dialog box to select a query favorite from an available list.</td>
</tr>
<tr>
<td>Add to Favorites</td>
<td>Allows you to add new queries from the Add Query dialog box.</td>
</tr>
<tr>
<td>Sort</td>
<td>Shows the Sort dialog box to sort Alarm Tree Viewer control data in ascending or descending order</td>
</tr>
<tr>
<td>Statistics</td>
<td>Shows the Alarm Statistics dialog box with the percentage of current retrieved alarm providers shown in the Alarm Tree Viewer control.</td>
</tr>
</tbody>
</table>

6. Click **OK** to close the Context Sensitive Menus dialog box.

7. Click **Apply**.

### Configuring Which Providers and Groups to Show

You configure alarm queries for alarm providers and groups that belong to the Alarm Tree Viewer control. The alarm query is a list of one or more alarm providers separated by spaces. The valid syntax for the alarm provider is as follows.

- **Full path to alarm provider:**
  - `\Node\ProviderName`
- **Path to local alarm provider:**
  - `\ProviderName`
- For multiple queries, separate each query with a space. For example:
  - `\InTouch\Node17\InTouch \MyNode\InTouch`

The default alarm query is `\InTouch`. You cannot use a tag for the alarm query.
If you query multiple alarm groups and later you undeploy one or more groups, the Alarm Tree Viewer control does not automatically update to remove these groups from the view. You must stop and re-start the alarm provider to un-register it.

If you query an ArchestrA Galaxy by specifying `\Galaxy` in your alarm query, then all InTouch alarm providers deployed within the Galaxy are shown. For example:

`\Node\Galaxy\Area[name]`

If you query information from a node with multiple alarm providers that contain groups with the same names, records are shown for the last alarm provider in the tree.

**To configure the alarm query**

1. Right-click the Alarm Tree Viewer control and then click Properties. The `AlarmTreeViewerCtrl Properties` dialog box appears.
2. Click the Query tab.
3. In the **Alarm Query** box, type the path to the initial alarm query.
4. Click Apply.

**Creating Custom Saved Queries Using Query Favorites**

You can configure a list of query favorites for operators to select from a shortcut menu.

The query file can be saved to any folder and does not need to be in the InTouch application folder. The alarm query file is an `.xml` file.

**To configure the query favorites file**

1. Right-click the Alarm Tree Viewer control and then click Properties. The `AlarmTreeViewerCtrl Properties` dialog box appears.
2. Click the Query tab.
3. Configure the query favorites file.
a. In the Query Favorites File box, type the network path and file name or click the ellipse button to browse for the file.

b. To edit the Filter Favorites file, click the Edit Favorites File button. The Alarm Query window opens, allowing you to add, modify, or delete filters from your favorites file. When you are done, click OK to save your changes and close the window.

4. Click OK.

**Configuring the Sort Order for Alarm Groups**

In the Alarm Tree Viewer control, nodes and alarm groups can be shown in alphabetical order, either ascending or descending.

**To configure the sort order of alarm groups**

1. Right-click the Alarm Tree Viewer control and then click Properties. The AlarmTreeViewerCtrl Properties dialog box appears.

2. Click the General tab.

3. Select the Sort Elements in Alphabetical Order check box to list alarm groups in alphabetical order.

4. Click Ascending or Descending to specify the sort direction.

5. Click OK.

**Using an Alarm Tree Viewer Control at Run Time**

Use the Alarm Tree Viewer control to navigate the hierarchy of alarm providers and alarm groups.

The Alarm Tree Viewer control can show multiple nodes and alarm providers.
• Nodes are represented by a computer icon.
• Alarm providers are represented by a speaker icon.
• Alarm groups are represented by a bell icon.

With one or more alarm groups selected, you can generate queries for alarms that can be used in the Alarm Tree Viewer control and the Alarm DB View controls. To select multiple alarm groups, hold down the shift key while clicking on a group. To un-select all groups, click on an empty area.

One or more of the following commands appears on the run-time shortcut menu, depending on how the control is configured:

- **Refresh** – Forces a manual update of the alarms.
- **Freeze** – Stops the alarms from updating.
- **Query Favorites** – Opens the Alarm Query dialog box where you can select an alarm query from a list of previously defined alarm queries.
- **Add to Favorites** – Opens the Add Query dialog box with a query string entered based on the selected Groups (if any).
- **Sort** – Opens the Sort dialog box with options to alphabetically sort alarm groups in ascending or descending order.
- **Statistics** – Opens the Alarm Statistics dialog box to show the percentage of retrieved alarm providers.

**Understanding Alarm Tree Viewer Control Status Bar Information**

The Alarm Tree Viewer control status bar appears at the bottom of the window and shows the following information:

- Name of the current query
- Percentage complete status of the current query

**Using Query Favorites**

Use the Query Favorites command on the Alarm Tree Viewer control's shortcut menu to quickly select and run a alarm query from a list of previously defined alarm queries. You can also create new named queries, edit an existing query, or delete an existing query.

**To select and run an alarm query**

1. Right-click the Alarm Tree Viewer control at run time.
2. Click Query Favorites. The Alarm Query dialog box appears.
3. Select the named query that you want to show in the list of currently defined queries.
4. Click OK. The Alarm Tree Viewer control shows alarm group information from the selected query.

**Using Alarm Tree Viewer Control ActiveX Properties**

You can set the value an Alarm Tree Viewer control property directly using a script or you can assign it to an InTouch tag or I/O reference. For more information about setting properties, see Scripting ActiveX Controls in the InTouch® HMI Scripting and Logic Guide.

The following table lists all Alarm Tree Viewer control properties. For more information on setting color values, see Configuring Colors for ActiveX Controls on page 65.
<table>
<thead>

</table>
Using Alarm Tree Viewer Control ActiveX Methods

You can use the Alarm Tree Viewer control methods in scripts to:

- Retrieve information about the control.
- Retrieve information about specific entries in the alarm hierarchy.
- Freeze the control.
- Create query strings.
- Run queries.

For more information about calling methods, see Scripting ActiveX Controls in the InTouch® HMI Scripting and Logic Guide.

Retrieving Information About the Control

You can use these methods to retrieve information about the Alarm Tree Viewer control.

- `AboutBox()` Method on page 77
- `GetElementCount()` Method on page 155

About Box()

Shows the Alarm Tree Viewer About dialog box.

GetElementCount() Method

Gets the total number of elements in the tree.

Syntax

```
Object.GetElementCount()
```
Example

The name of the control is AlarmTreeViewerCtrl1 and nTag1 is an integer or real tag.

\[ \text{nTag1} = \#\text{AlarmTreeViewerCtrl1}.\text{GetElementCount}(); \]

Retrieving Information About Specific Entries

You can use a set of methods to retrieve information about elements shown in the Alarm Tree Viewer control window.

- **CheckElementMembership() Method** on page 156
- **GetElementCount() Method** on page 155
- **GetElementName() Method** on page 156
- **GetElementPath() Method** on page 157
- **GetSelectedElementCount() Method** on page 157
- **GetSelectedElementName() Method** on page 157
- **GetSelectedElementPath() Method** on page 157
- **GetSubElementCount() Method** on page 158
- **GetSubElementName() Method** on page 158
- **GetSubElementPath() Method** on page 159

**CheckElementMembership() Method**

Checks if the descendant tree element is part of the ancestor tree element.

**Syntax**

\[ \text{Object}.\text{CheckElementMembership}(\text{PathName, DescendantElementName, AncestorElementName}) \]

**Parameter**

- **PathName**
  The name of the path. For example, InTouch or \NodeName.
- **DescendantElementName**
  The name of the descendant element name. For example, GroupA.
- **AncestorElementName**
  The name of the ancestor element name. For example, GroupB.

**GetElementCount() Method**

Gets the total number of elements in the tree.

**Syntax**

\[ \text{Object}.\text{GetElementCount}() \]

**Example**

The name of the control is AlarmTreeViewerCtrl1 and nTag1 is an integer or real tag.

\[ \text{nTag1} = \#\text{AlarmTreeViewerCtrl1}.\text{GetElementCount}(); \]

**GetElementName() Method**

Gets the element name corresponding to the index.
**Viewing Alarm Hierarchies**

**InTouch HMI Alarms and Events Guide**

### Syntax

```
Object.GetElementName(ElementIndex)
```

**Parameter**

*ElementIndex*

The index of the element.

**Example**

The name of the control is AlarmTreeViewerCtrl1 and StrTag is a message tag.

```
StrTag = #AlarmTreeViewerCtrl1.GetElementName(3);
```

### GetElementPath() Method

Gets the element path corresponding to the index, down to the indicated expansion level.

**Syntax**

```
Object.GetElementPath(ElementIndex, ExpansionLevel)
```

**Parameter**

*ElementIndex*

The index of the element.

*ExpansionLevel*

The level of expansion.

**Example**

The name of the control is AlarmTreeViewerCtrl1, StrTag is a message tag, and returns the path of the element at index 17 up to 4 levels.

```
StrTag = #AlarmTreeViewerCtrl1.GetElementPath(17, 4);
```

### GetSelectedElementCount() Method

Gets the number of selected elements in the tree.

**Syntax**

```
Object.GetSelectedElementCount()
```

**Example**

The name of the control is AlarmTreeViewerCtrl1 and nTag1 is an integer or real tag.

```
nTag1 = #AlarmTreeViewerCtrl1.GetSelectedElementCount();
```

### GetSelectedElementName() Method

Gets the name of the selected element on the Alarm Tree Viewer control.

**Syntax**

```
Object.GetSelectedElementName()
```

**Example**

The name of the control is AlarmTreeViewerCtrl1 and StrTag is a message tag.

```
StrTag = #AlarmTreeViewerCtrl1.GetSelectedElementName();
```

### GetSelectedElementPath() Method

Gets the path of the selected element to the indicated expansion level.

**Syntax**

```
Object.GetSelectedElementPath(ExpansionLevel)
```
Parameter

*ExpansionLevel*
The level of expansion.

**Example**
The name of the control is AlarmTreeViewerCtrl1 and StrTag is a message tag.
\[
\text{StrTag} = \#\text{AlarmTreeViewerCtrl1}.\text{GetSelectedElementPath}(3);
\]

**GetSubElementCount() Method**
Gets the total number of sub-elements from the indicated element.

**Syntax**
\[
\text{Object.GetSubElementCount}(\text{Path}, \text{ElementName})
\]

**Parameter**

*Path*
The name of the path. For example:
\[
\text{\NodeName}\text{\InTouch}
\]
If the path parameter is empty, the Alarm Tree Viewer control finds the first element of the tree that matches the indicated element name.

*ElementName*
The name of the element. For example, Group1.

**Examples**
The name of the control is AlarmTreeViewerCtrl1 and nTag1 is an integer or real tag.
\[
n\text{Tag}1 = \#\text{AlarmTreeViewerCtrl1}.\text{GetSubElementCount}(\"\", \"\text{Group1}\"");
n\text{Tag}1 = \#\text{AlarmTreeViewerCtrl1}.\text{GetSubElementCount}(\"\\text{\NodeName}\text{\InTouch}\", \"\text{Group1}\"");
n\text{Tag}1 = \#\text{AlarmTreeViewerCtrl1}.\text{GetSubElementCount}(\"\text{\InTouch}\", \"\text{Group1}\"");
n\text{Tag}1 = \#\text{AlarmTreeViewerCtrl1}.\text{GetSubElementCount}(\"\\text{\NodeName}\text{\InTouch}\", \"\text{Group1}\"");
\]

**GetSubElementName() Method**
For the indicated element, gets the name of the sub-element at the corresponding index.

**Syntax**
\[
\text{Object.GetSubElementName}(\text{Path}, \text{ElementName}, \text{ElementIndex})
\]

**Parameter**

*Path*
The name of the path. For example:
\[
\text{\NodeName}\text{\InTouch}
\]
If the path parameter is empty, the Alarm Tree Viewer control finds the first element of the tree that matches the indicated element name.

*ElementName*
The name of the element. For example, Group1.

*ElementIndex*
The index of the element.

**Examples**
The name of the control is AlarmTreeViewerCtrl1 and StrTag is a message tag.
\[
\text{StrTag} = \#\text{AlarmTreeViewerCtrl1}.\text{GetSubElementName}(\"\", \"\text{Group1}\", 1);
\text{StrTag} = \#\text{AlarmTreeViewerCtrl1}.\text{GetSubElementName}(\"\text{\NodeName}\text{\InTouch}\", \"\text{Group1}\", 1);
\text{StrTag} = \#\text{AlarmTreeViewerCtrl1}.\text{GetSubElementName}(\"\text{\InTouch}\", \"\text{Group1}\", 1);
\]
StrTag = #AlarmTreeViewerCtrl1.GetSubElementName("\\NodeName\InTouch", "Group1", 1);

GetSubElementPath() Method

Gets the path of the sub-element from the index of the element name to the indicated expansion level.

Syntax

```
Object.GetSubElementPath(Path, ElementName, ElementIndex, ExpansionLevel)
```

Parameter

- **Path**
  - The name of the path. For example: \\
  
  `\\NodeName\InTouch`
  
  If the path parameter is empty, the Alarm Tree Viewer control finds the first element of the tree that matches the indicated element name.

- **ElementName**
  - The name of the element. For example, Group1.

- **ElementIndex**
  - The index of the element.

- **ExpansionLevel**
  - The level of expansion.

Examples

The name of the control is AlarmTreeViewerCtrl1 and StrTag is a message tag.

```
StrTag = #AlarmTreeViewerCtrl1.GetSubElementPath("", "Group1", 1, 3);
StrTag = #AlarmTreeViewerCtrl1.GetSubElementPath("\\NodeName", "Group1", 1, 3);
StrTag = #AlarmTreeViewerCtrl1.GetSubElementPath("\\InTouch", "Group1", 1, 3);
StrTag = #AlarmTreeViewerCtrl1.GetSubElementPath("\\NodeName\\InTouch", "Group1", 1, 3);
```

Freezing the Tree

You can use the Freeze() method to prevent the Alarm Tree Viewer control tree from being updated with any further changes.

Freeze() Method

Freezes the Alarm Tree Viewer control tree.

Syntax

```
Object.Freeze(Frozen)
```

Parameters

- **Frozen**
  - Controls whether the tree can be updated.

- 1 = Freezes the tree.
- 0 = Unfreezes the tree.

Example

`Tag1` is defined as memory discrete tag and the name of the control is AlarmTreeViewerCtrl1.

```
Tag1 = 1;
#AlarmTreeViewerCtrl1.Freeze(Tag1);
```
Creating a Query String from a Selection

You can use the GetAlarmQueryFromSelection() method to retrieve a query string from a selected element in the Alarm Tree Viewer control. The query string can then be used dynamically in an Alarm Viewer control.

GetAlarmQueryFromSelection() Method

Returns an alarm query string from the selected element in the Alarm Tree Viewer control.

Syntax

```csharp
Object.GetAlarmQueryFromSelection()
```

Example

The name of the control is AlarmTreeViewerCtrl1 and StrTag is a message tag. For example: StrTag is set to \NodeName\InTouch\GroupA.

```csharp
StrTag = #AlarmTreeViewerCtrl1.GetAlarmQueryFromSelection();
```

Running Queries

You can run queries for the Alarm Tree Viewer control using methods that either retrieve an existing query saved in a query favorites file or set a string that specifies a new collection of alarm providers.

- `SetQueryByName()` Method on page 74
- `SetQueryByString()` Method on page 160

SetQueryByName() Method

Sets the current query as specified by the query name passed. The query must be in the query favorites file.

Syntax

```csharp
Object.SetQueryByName(QueryName)
```

Parameter

- **QueryName**
  The name of the query as created by using query favorites. For example, Turbine Queries.

Example

The name of the control is AlarmTreeViewerCtrl1.

```csharp
#AlarmTreeViewerCtrl1.SetQueryByName("Turbine Queries");
```

SetQueryByString() Method

Sets the current query as a new string specifying a new collection of Alarm Providers.

Syntax

```csharp
Object.SetQueryByString(NewQuery)
```

Parameters

- **NewQuery**
  String containing an alarm query. For example: \MasterNode\InTouch

Example

The name of the control is AlarmTreeViewerCtrl1.

```csharp
#AlarmTreeViewerCtrl1.SetQueryByString("\MasterNode\InTouch");
```
Error Handling While Using Methods and Properties

All Alarm Tree Viewer control error messages are sent to the Logger. If you configure the Alarm Tree Viewer control to run in silent mode, no run-time errors are shown.

Using Alarm Tree Viewer Control ActiveX Events to Trigger Scripts

You can assign QuickScripts to Alarm Tree Viewer control events, such as a mouse click or double-click. When the event occurs, the QuickScript runs.

The Alarm Tree Viewer control supports the following events:

- Click
- DoubleClick
- ShutDown
- StartUp

The Click event has one parameter called ClicknElementID, which identifies the element in the tree that is clicked at run time.

The DoubleClick event has one parameter called DoubleClicknElementID, which identifies the element in the tree that is double-clicked at run time.

For the Click and DoubleClick events, an ElementID of -1 is returned for the "All Providers" node.

Note: The Alarm Tree Viewer control ignores the user interface methods when they are called from the StartUp event, because the control is not visible yet. These methods include: AboutBox(), CheckElementMembership(), Freeze(), GetAlarmQueryFromSelection(), GetElementCount(), GetElementName(), GetElementPath(), GetSelectedElementCount(), GetSelectedElementName(), GetSelectedElementPath(), GetSubElementCount(), GetSubElementName(), GetSubElementPath(), and Refresh().

For more information about scripting ActiveX events, see Scripting ActiveX Controls in the InTouch® HMI Scripting and Logic Guide.
CHAPTER 8
Printing Alarms

In This Chapter

About Printing Alarms ................................................................. 163
Configuring Alarm Printing and Logging ........................................ 163
About Printing Alarms With the Alarm Printer ................................... 173
Logging Alarms to a File .............................................................. 174
Starting Alarm Printer with a Specific Configuration .......................... 174
Controlling the Alarm Printer Using Scripting .................................... 175

About Printing Alarms

You use the InTouch Alarm Printer utility to print alarms from multiple nodes. You can print alarm records stored in the alarm memory on an event-by-event basis using a dedicated line or network printer. Also, you can use the Alarm Printer to save alarm records to a file.

You can configure the Distributed Alarm system to print certain events on a line printer as they occur. Typically, you print alarms immediately to record information in the event of a catastrophic failure. Generally, you use a dot matrix printer connected through a serial or parallel port directly to the computer running the InTouch application. Windows network printers and laser printers are usually inappropriate for gathering data for catastrophic events because they hold entire pages in memory before actually printing a page.

Configuring Alarm Printing and Logging

You can run multiple instances of the Alarm Printer. Each instance of the Alarm Printer must be configured to print to a different printer and must be configured with a separate alarm query.

You can configure separate instances of Alarm Printer to print alarms in specific priority ranges. For example, one Alarm Printer instance can print only high priority alarms, while another instance prints only low priority alarms. Likewise, you can use one instance of the Alarm Printer to print alarms from one area of the factory while another instance prints alarms from a different area.

You can save an Alarm Printer configuration to a file, which has the .alc extension. You can create as many configuration files as you want. The Alarm Printer uses an individual configuration file for each instance of Alarm Printer that is running.
Configuring Printer Settings

You must designate a printer to use with the Alarm Printer. Also, you must select if alarms are printed as they occur. Use a dedicated printer for printing alarms. The printer can be connected locally or to a network. Any Windows printer can be used as the output for the Alarm Printer.

To configure the printer settings
1. Open the Alarm Printer utility. Do the following:
   a. In the WindowMaker Tools view, expand Applications.
   b. Double-click Alarm Printer.
2. On the menu bar, click Configure. The Configuration Settings dialog box appears.
3. Click the Printing tab.

![Configuration Settings dialog box]

4. In the Print To area, select the connection to the alarm printer.
   o Click None to not use a printer.
   o Click LPT1-3 to use a printer connected by a parallel port to the computer running the InTouch application.
   o Click COM1-4 to use a printer connected by a serial port to the computer running the InTouch application. Click Port Configuration to show the COM Properties dialog box and change the default values assigned to the selected COM port.
   o Click Printer to use a printer connected through the network to the computer running the InTouch application. In the box, type the name of the printer or click Browse to select an available printer.

   Note: If the printer you want does not appear, add the printer using the Windows Add Printer wizard.

5. Select the Remove Trailing Spaces in Printout check box to prevent the printer from printing blank lines or empty pages.
6. Select the Enable Printing check box to print alarms.
7. Select the Disable Realtime Alarm Printing check box to prevent the Alarm Printer from printing alarms as they occur.
8. Optionally, configure print command sequences to initialize the printer with specific settings and to change the print characteristics for alarms in a specified priority range. For more information, see Configuring Alarm Print Commands on page 165.

9. Click OK.

**Configuring Alarm Print Commands**

You can configure the Alarm Printer to send a printer command initialization sequence when the printer is first opened (that is, each time the query starts and stops). Printer command initialization sequences can be used to configure printer settings, such as the character pitch and the left and right print margins.

You can also configure alternate and normal print colors so that the print color indicates whether the alarm is in or outside of a specified range of alarm priorities. The alternate and normal color commands do not necessarily have to specify a color. They can also be used to enable/disable double-striking, emphasized printing, underlining, italic, or other differentiating print characteristics to make one set of alarm priorities appear visually distinct from the others.

**Note:** For monochrome printers, you might find that double-strike printing is much faster than emphasized printing.

**Print Command Settings**

The **Printing** tab in the **Configuration Settings** dialog box includes settings for specifying printer command sequences.

These settings are described in the following table.

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Enable initialize printer codes</td>
<td>Causes the command sequence that is entered in the accompanying box to be sent to the printer each time the query is started and stopped.</td>
</tr>
<tr>
<td>Enable alternate color printing for alarm priority range</td>
<td>Select this option to pass the alternate and normal color commands for use with the specified alarm priority range.</td>
</tr>
</tbody>
</table>
### Setting | Description
--- | ---
Change text for alarms from priority … to priority | Enter the alarm priority range from a low number (representing higher priority alarms) to a higher number (representing lower priority alarms).

Alternate color | The printer command sequence that will be sent each time a row of alarm text is sent to the printer when the alarm priority is in the specified range.

Normal color | The printer command sequence that will be sent each time a row of alarm text is sent to the printer when the alarm priority is not in the specified range.

---

**Sample Printer Command Sequences**

As an example, the following printer command sequences are for an Okidata Microline 395C color dot matrix printer. Refer to the documentation that accompanied your printer for its command sequences.

**Printer initialization command:**

```
CAN ESC @ ESC M ESC SI CR
```

where the commands are as follows:

- **CAN** – Cancel any remaining data in the printer’s internal buffer.
- **ESC @** – Reset the printer to menu defaults.
- **ESC M** – Set the printing to 12 CPI (Elite).
- **ESC SI** – Set printing to compressed to obtain 20 CPI.
- **CR** – Move the print head back to the left margin.

**Alternate color command that sets the print color to red:**

```
ESC r 1
```

**Normal color command that sets the print color to black:**

```
ESC r 0
```

### Printer Command Escape Sequences Syntax

Each printer command escape sequence consists of one or more bytes. Information about these bytes should be available in the printer’s documentation or by knowing that the printer can parse ESC/P or ESC/P2 syntax. Information about these syntaxes is publicly available on the Internet.

Generally, there is no limitation on the length of the printer command escape sequence text. The parser interprets the stream of text tokens and converts them to a sequence of contiguous byte values. The byte values are then streamed to the printer, unmodified, at the appropriate time, such as at printer initialization or when the printer setting for the alarm must be modified and restored.

When specifying the printer command escape sequence as text, each byte character must be separated by a space character. The space character indicates to the parser where a token begins and ends. For example, if the printer’s draft mode can be activated by ESCx0, then the command sequence is entered as:

```
ESC x 0
```
If you need to send a space character to the printer, then use the abbreviation \texttt{SP} to represent that byte.

\textbf{Note:} The parser is case-sensitive, so all abbreviations must be entered in capital letters. For example, use \texttt{ESC}, not \texttt{esc} or \texttt{Esc}.

The following types of items can be included in the command sequence:

- The abbreviated name of the control characters
- The number, letter, or other printable character
- The decimal number for the ASCII character
- The hexadecimal number for the ASCII character

For a list of the hexadecimal or decimal numbers for the control and printable characters, refer to a publicly available ASCII table.

\textbf{Entering Names of Control Characters}

You can enter the names of control characters, as these are not easily typed from the keyboard. For a list of control character names, refer to the Abbr column of a publicly available ASCII table. The only character that is not typically listed in an ASCII table is the space character, which must be entered as \texttt{SP}.

\textbf{Note:} The parser does not process common C language escape characters (for example, \texttt{\textbackslash r}, \texttt{\textbackslash n}, and \texttt{\textbackslash t}).

\textbf{Entering Printable Characters}

Enter any printable character by typing it in the box. The only exception is the space character (hexadecimal 0x20, decimal 32), which must be entered as \texttt{SP}. The character's value is interpreted as the number that represents it in the ASCII table, and that is the value sent to the printer.

For a list of printable characters, refer to a publicly available ASCII table.

\textbf{Entering a Character's Decimal Number}

Enter the character's decimal number by typing it in the box. The maximum decimal value that can be entered is 255 (hexadecimal 0xFF). There is no warning if you enter a decimal number that is too large, such as 497; it will cause 255 to be returned. Negative numbers are not supported.

\textbf{Entering a Character's Hexadecimal Number}

Enter the character's hexadecimal number by typing it in the box. The allowable range of values is 0x00 to 0xFF.

\textbf{Configuring Which Alarms to Print}

The Alarm Printer queries the alarm memory to select records to print or save to a log file. The query selects records from the internal alarm memory based upon:

- Alarm priority
- Current alarm state (unacknowledged/acknowledged)
- Alarm group membership

Each alarm has an assigned priority number that represents the severity of the alarm. An alarm priority ranges from 1 to 999. The most severe alarm is assigned a priority of 1. The least severe alarm is assigned a priority of 999.
If a network or printer connection fails, the Alarm Printer does not reprint all alarms. The Alarm Printer only prints the alarms that have not been printed before the connection failure.

**To configure which alarms to print**

1. Open the Alarm Printer utility. Do the following:
   a. In the WindowMaker **Tools** view, expand **Applications**.
   b. Double-click **Alarm Printer**.
2. On the menu bar, click **Configure**. The **Configuration Settings** dialog box appears.
3. Click the **Query** tab.

4. In the **From Priority** box, enter the highest priority alarm value (1 to 999).
5. In the **To Priority** box, enter the lowest priority alarm value (1 to 999).
6. In the **Alarm State** list, click the alarm state.

<table>
<thead>
<tr>
<th>Click</th>
<th>To show</th>
</tr>
</thead>
<tbody>
<tr>
<td>All</td>
<td>All alarms.</td>
</tr>
<tr>
<td>Ack</td>
<td>Only acknowledged alarms.</td>
</tr>
<tr>
<td>Unack</td>
<td>Only unacknowledged alarms.</td>
</tr>
</tbody>
</table>

7. In the **Alarm Query** box, type one or more alarm queries. You can specify one or more alarm providers and groups. Use blank spaces to separate the queries.
8. Select the **Record alarms generated after query starts** check box to only include alarms that occur after the query starts. The Alarm Printer ignores alarms records that are in the alarm memory and were triggered before the Alarm Printer started querying.
9. Click **OK**.

**Configuring the Format of Print and File Output**

Each option you select appears as a separate field in the printed output. Fields containing data exceeding the specified maximum field length are truncated to those limits.
To configure the format of alarm print and file output

1. Open the Alarm Printer utility. Do the following:
   a. In the WindowMaker **Tools** view, expand **Applications**.
   b. Double-click **Alarm Printer**.
2. On the menu bar, click **Configure**. The **Configuration Settings** dialog box appears.
3. Click the **Message** tab.

![Configuration Settings dialog box](image)

4. In the **Date/Time** area, select the **Date** check box, and then select a date format from the list. The listed date formats include the following components:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DD</td>
<td>Two-digit day of the month (01-31)</td>
</tr>
<tr>
<td>MM</td>
<td>Two-digit month of the year (01-12)</td>
</tr>
<tr>
<td>YY</td>
<td>Last two digits of the year</td>
</tr>
<tr>
<td>YYYY</td>
<td>Four-digit year</td>
</tr>
<tr>
<td>MMM</td>
<td>Three-character abbreviation of the month</td>
</tr>
</tbody>
</table>

5. Select the **Time** check box and select a time format from the list. The listed formats included the following time components:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>AP</td>
<td>Selects the AM/PM time format. For example, 3:00 PM is shown as 3:00 PM. A time without this designation defaults to 24 hour military time format. For example, 3:00 PM is shown as 15:00.</td>
</tr>
<tr>
<td>HH</td>
<td>Two-digit hour of the day (00-23 or 01-12) when the alarm/event occurred.</td>
</tr>
<tr>
<td>MM</td>
<td>Two-digit minute of the hour (00-59) when the alarm/event occurred.</td>
</tr>
</tbody>
</table>
Option | Description
--- | ---
SS | Two-digit second of the minute (00-59) when the alarm/event occurred.
SSS | Three-digit millisecond of the second when the alarm/event occurred.

6. Select the order that alarms appear in the alarm record according to the onset time of the alarm:

Option | Description
--- | ---
OAT | (Original Alarm Time) The date/time stamp of the onset of the alarm.
LCT | (Last Changed Time) The date/time stamp of the most recent change of status for the instance of the alarm: onset of the alarm, change of sub-state, return to normal, or acknowledgment.
LCT But OAT on ACK | (Last Changed Time, but Original Alarm Time on acknowledgement ) The last changed time is used while the alarm is unacknowledged, then original alarm time is used after the alarm has been acknowledged.

7. Select the alarm information to be printed.

Option | Description
--- | ---
Alarm State | Prints the alarm state. For example, UnAck, Ack.
Alarm Class | Prints the alarm class. For example, VALUE, DEV, ROC.
Alarm Type | Prints the alarm type. For example, HIHI, LO, MAJDEV.
Priority | Prints the alarm priority (1-999).
7.1 Default (button) | Selects the default settings for the Alarm Printer utility for InTouch version 7.1.
7.11 Default (button) | Selects the default settings for the Alarm Printer utility for InTouch version 7.11.
Remove Trailing Spaces | Removes the extra trailing spaces from a printed field when the length of the actual field value is less than the value configured for that field.
Minimum Column Spacing | Reduces the spacing between columns so that more fields can fit on the printed page.
Alarm Name | Prints the alarm name (tag). In the Length box, type the number of characters (64 characters maximum) for the alarm name.
<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Group Name</td>
<td>Prints the alarm group name. In the Length box, type the number of characters (64 characters maximum) for the alarm group name.</td>
</tr>
<tr>
<td>Alarm Provider</td>
<td>Prints the name of the alarm provider. In the Length box, type the number of characters (64 characters maximum) for the alarm provider name.</td>
</tr>
<tr>
<td>Value at Alarm</td>
<td>Prints the value of the tag. In the Length box, type the number of characters (32 characters maximum) for the alarm value.</td>
</tr>
<tr>
<td>Limit</td>
<td>Prints the tag's alarm limit. In the Length box, type the number of characters (32 characters maximum) allowed for alarm limit. The number should be large enough to provide the desired level of precision.</td>
</tr>
<tr>
<td>Operator Node</td>
<td>Prints the operator node associated with the alarm condition. In the Length box, type the number of characters (64 characters maximum) allowed for the operator's node. In a Terminal Services environment, this is the name of the client computer that the respective operator established the Terminal Services session from. If the node name can't be retrieved, the node's IP address is used instead.</td>
</tr>
<tr>
<td>Operator Name</td>
<td>Prints the operator name associated with the alarm condition. In the Length box, type the number of characters (16 characters maximum) allowed for the operator's name.</td>
</tr>
<tr>
<td>Comment</td>
<td>Prints the alarm comment associated with the tag. In the Length box, type the number of characters (131 characters maximum) allowed for the comment.</td>
</tr>
<tr>
<td>User1</td>
<td>Prints the numerical values of User Defined Number 1 corresponding to the alarm.</td>
</tr>
<tr>
<td>User2</td>
<td>Prints the numerical values of User Defined Number 2 corresponding to the alarm.</td>
</tr>
<tr>
<td>User3</td>
<td>Prints the string value of the user-defined string property associated with the alarm. The maximum number of characters is 131.</td>
</tr>
</tbody>
</table>

8. Click **Apply**.

**Configuring Log Files for Alarms**

You can log alarm records to a file. By default, the Alarm Printer assigns names to log files based upon the following naming convention:

YYMMDDHH.ALG
To configure alarm record logging

1. Open the Alarm Printer utility. Do the following:
   a. In the WindowMaker Tools view, expand Applications.
   b. Double-click Alarm Printer.
2. On the menu bar, click Configure. The Configuration Settings dialog box appears.
3. Click the File Logging tab.

4. Select the Enable Alarm File Logging check box to save alarm records to log files.
5. In the Directory box, type the path or browse to a folder location to save the alarm log files.
6. In the Number of Hours to Cycle Filename box, enter the number of hours worth of alarm records to save to an individual log file.

   Valid entries are 1 to 24. If your InTouch application runs continuously, select a file logging interval that creates a set of equal length daily log files. For example, setting Number of Hours to Cycle Filename to 6 creates 4 equal length daily log files.

7. In the Starting at Hour box, enter the starting hour to begin logging alarm records to a file each day.

   Valid entries are 0 to 23.
For example, an oil refinery operates three daily work shifts. The first shift begins at 06:00. Management wants alarm records logged for each shift. To do this, enter 8 for the **Number of Hours to Cycle Filename** option. Enter 6 for the **Starting at Hour (0-23)** option. The Alarm Printer creates a log file from 06:00 to 14:00, another from 14:00 to 22:00, and a third from 22:00 to 06:00.

8. In the **Keep Log Files for** box, enter the number of days to retain log files.

The Alarm Printer saves log files for the number of specified days plus the current day. The Alarm Printer deletes log files older than the retention period. To save log files indefinitely, enter 0.

9. In the **Log File Name Extension** box, accept the default ALG file name extension or assign another three-character extension to log files.

If you use a .csv extension, you can import the log file directly into Excel or Notepad.

10. To remove spaces at the end of entries within a log file, select the **Remove Trailing Spaces in Log Entries** check box.

You can also specify a field separator character placed at the end of each record in the log file.

11. Select the **Original Column Ordering** check box to maintain the same order from the alarm display to log file records.

12. Click **Apply**.

### Saving and Loading Configuration Files

When you start the Alarm Printer from WindowMaker, the **Alarm Printer** dialog box shows the default configuration settings. These configuration settings are saved in an alarm configuration file (.alc).

You can save your printer configuration settings to a file that can be loaded before printing alarms.

A specific alarm configuration file can be shown if it is opened in run time from the command prompt or by double-clicking its *.alc file name.

**To create a new Alarm Printer configuration file**

1. Open the Alarm Printer utility. Do the following:
   a. In the WindowMaker **Tools** view, expand **Applications**.
   b. Double-click **Alarm Printer**.
2. On the **File** menu, click **New** to show the Alarm Printer with its default values.
3. On the menu bar, click **Configure**. The **Configuration Settings** dialog box appears.
4. Configure the alarm settings.
5. On the **File** menu, select **Save**.

**To edit an existing Alarm Printer configuration file**

1. On the File menu, select Open.
2. Select the Alarm Printer Configuration file that you want to edit.
3. Edit the file.
4. On the File menu, select Save. Select Save as to save the changes to a new file without changing the existing file.

### About Printing Alarms With the Alarm Printer

Each query logs all of the alarms specified in the Alarm Printer configuration file (.alc) that is currently open. If no file has been specified, the settings currently selected during Alarm Printer configuration are used.
You can run multiple queries with Alarm Printer. Each query uses different parameters and is associated with a separate instance of the Alarm Printer. If two instances of Alarm Printer are running the same query, the entries are duplicated.

While Alarm Printer is running, you can manually start or stop queries. Be sure that you have printing enabled.

**To start an alarm query**

- On the **Query** menu, click Start/Stop.

**To stop an alarm query**

- On the **Query** menu, click Start/Stop.

### Logging Alarms to a File

You can use the Alarm Printer to log alarm records to a file. You should have already configured logging from the **Configuration Settings** dialog box.

**To log alarms to a file**

1. Open the Alarm Printer utility.
   a. In the WindowMaker **Tools** view, expand **Applications**.
   b. Double-click **Alarm Printer**.
2. If necessary, configure the query to collect alarm records for logging.
3. Click the **File Logging** button.
4. Run an alarm query.

Alarm records collected by the query are written to the configured log file.

### Starting Alarm Printer with a Specific Configuration

You can automatically start the Alarm Printer and open a specific file when your system starts up by using the following command in a batch file:

```
ALMPRT.EXE MYQUERY.ALC
```

Where, **MYQUERY.ALC** is the name of the Alarm Printer configuration file that opens. Specifying the .exe file name extension is optional.
Make sure that the batch file switches to the folder where the InTouch HMI is installed.

To prevent the loss of any query data due to a system inadvertently being shut down and restarted, you can automatically start the Alarm Printer and automatically run a specific query by running the following command from a batch file:

```
ALMPRT.EXE -q MYQUERY.ALC
```

By using the `-q` in the command, your query runs automatically when the system starts up.

## Controlling the Alarm Printer Using Scripting

You can use Alarm Printer functions in scripts to control alarm printing.

Alarm printer functions return an integer error code that indicates whether the function completed successfully or not. The following table shows the error codes.

<table>
<thead>
<tr>
<th>Error Code</th>
<th>Error Message</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Success</td>
</tr>
<tr>
<td>1</td>
<td>Instance not found or not running</td>
</tr>
<tr>
<td>2</td>
<td>Interface not initialized</td>
</tr>
<tr>
<td>3</td>
<td>Failure to access virtual memory</td>
</tr>
<tr>
<td>4</td>
<td>Invalid error code</td>
</tr>
<tr>
<td>5</td>
<td>Too many instances already running</td>
</tr>
<tr>
<td>6</td>
<td>Result string would be too long</td>
</tr>
<tr>
<td>7</td>
<td>Invalid instance index passed to the function</td>
</tr>
<tr>
<td>8</td>
<td>Failed to post the message to the alarm printer application</td>
</tr>
<tr>
<td>9</td>
<td>Failed to wait for a response from the alarm printer application</td>
</tr>
<tr>
<td>20</td>
<td>To priority must be equal to or greater than From priority</td>
</tr>
<tr>
<td>21</td>
<td>Invalid priority value</td>
</tr>
<tr>
<td>22</td>
<td>Invalid alarm state</td>
</tr>
<tr>
<td>23</td>
<td>Failed to execute the command because the query is running</td>
</tr>
<tr>
<td>24</td>
<td>Query string is not valid</td>
</tr>
<tr>
<td>25</td>
<td>Invalid query processing state</td>
</tr>
<tr>
<td>26</td>
<td>Invalid print state selector</td>
</tr>
<tr>
<td>27</td>
<td>Command received by the alarm printer window is not recognized</td>
</tr>
<tr>
<td>28</td>
<td>Query could not be started</td>
</tr>
</tbody>
</table>
Stopping and Starting an Alarm Printer Instance or Query

Use the following functions to start and stop the Alarm Printer instance and the alarm query.

- **APUStartInstance() Function** on page 176
- **APUStartQuery() Function** on page 176
- **APUSTopInstance() Function** on page 177
- **APUSTopQuery() Function** on page 178

**APUStartInstance() Function**

Starts an instance of the Alarm Printer in a minimized state with values specified from a configuration file.

**Category**

View

**Syntax**

```
[Result=] APUStartInstance(sFilePath, iTagInstance);
```

**Arguments**

- **sFilePath**
  
  Full path to a configuration file (input string).

- **iTagInstance**

  Integer tag. The function returns an instance number to it if the function executes successfully.

**Remarks**

You can start up to sixteen instances of the Alarm Printer. This function writes the instance number (0 - 15) to the iTagInstance parameter. The instance number increments when a new Alarm Printer instance starts.

This instance number can be used by other Alarm Printer functions to identify the Alarm Printer instance.

This function returns 0 or, in the case of error, an error code.

The Alarm Printer program does not automatically begin processing alarms from the alarm memory. Use the **APUStartQuery()** function to begin processing data from the alarm memory for the instance.

**Example**

```
Status = APUStartInstance("c:\MyAlarmCfg\Area1Alarms.alc", Inst);
```

**See Also**

- APUStartQuery(), APUSTopInstance(), APUSTopQuery()
Arguments

iInstance
The instance of Alarm Printer (0 to 15).

iYear
The number of the year.

iMonth
The number of the month.

iDay
The day of the month.

iHour
The hour number.

iMinute
The minute number.

Remarks
An error occurs if you try to start a query when a query is already running.

If you set all date and time values to 0, all alarms are printed. This is because 0 is interpreted as January 01, 1900 at midnight. The time and dates specified are in local time. A value of -1 for the year sets the date to the current time that the command is processed.

Returns an integer error code.

Example
Status = APUStartQuery(Inst, 2007, 4, 16, 22, 12);

See Also
APUStartInstance(), APUStopInstance(), APUStopQuery()

APUStopInstance() Function

Stops a specified instance of the Alarm Printer. Any further addition of records to be printed stops, any currently executing print query stops, and the instance of the program closes.

Category
View

Syntax
[Result=] APUStopInstance(iInstance);

Arguments

iInstance
The instance of Alarm Printer (0 to 15).

Remarks
Returns an integer error code.

Example
Status = APUStopInstance(5);

See Also
APUStartInstance(), APUStartQuery(), APUStopQuery()
**APUStopQuery() Function**

Requests the specified instance to stop running its query. The application remains running, but it does not process any queries. A call to **APUStartQuery()** can cause the instance to start querying.

**Category**

View

**Syntax**

```plaintext
[Result=] APUStopQuery(iInstance);
```

**Arguments**

- `iInstance`
  The instance of Alarm Printer (0 to 15).

**Remarks**

Returns an integer error code.

**Example**

```plaintext
Status = APUStopQuery(5);
```

**See Also**

APUStartInstance(), APUStartQuery(), APUStopInstance()

---

**Querying Alarm Query Information**

Use the following functions to retrieve query parameters based on tag priorities and values set within the Alarm Printer configuration file.

- **APUGetAlarmGroupText() Function** on page 178
- **APUGetQueryFromPriority() Function** on page 179
- **APUGetQueryToPriority() Function** on page 179
- **APUGetConfigurationFilePath() Function** on page 180
- **APUGetPrinterJobCount() Function** on page 181
- **APUGetQueryAlarmState() Function** on page 181
- **APUGetQueryProcessingState() Function** on page 182

---

**APUGetAlarmGroupText() Function**

Gets the Alarm Query alarm group text.

**Category**

View

**Syntax**

```plaintext
[Result=] APUGetAlarmGroupText(iInstance,sTagGroup);
```

**Arguments**

- `iInstance`
  The instance of Alarm Printer (0 to 15).

- `sTagGroup`
  Text - alarm group
Remarks
The initial alarm group text is read from the .alc configuration file that the Alarm Printer with the specified instance is using. The alarm group text is passed to the sTagGroup parameter into an InTouch message tag.

Returns an integer error code.

Example
The TagGroup message tag can contain the following value after the function is run: \
Status = APUGetAlarmGroupText(Inst,TagGroup);

See Also
APUGetConfigurationFilePath(), APUGetPrinterJobCount(), APUGetQueryAlarmState(), APUGetQueryFromPriority(), APUGetQueryProcessingState(), APUGetQueryToPriority()

APUGetQueryFromPriority() Function
Gets the From Priority value for a query.

Category
View

Syntax

Arguments

Remarks
The initial priority is read from the .alc file that the Alarm Printer with the specified instance is using. The From Priority value is passed to the iTagPriority parameter into an InTouch integer tag.

Returns an integer error code.

Example
In this example, FromPri is an integer tag that contains the From Priority value, such as 1.

Status = APUGetQueryFromPriority(Inst, FromPri);

See Also
APUGetAlarmGroupText(), APUGetConfigurationFilePath(), APUGetPrinterJobCount(), APUGetQueryAlarmState(), APUGetQueryProcessingState(), APUGetQueryToPriority()

APUGetQueryToPriority() Function
Gets the To Priority from the query.

Category
View

Syntax

Arguments

Remarks
The initial priority is read from the .alc file that the Alarm Printer with the specified instance is using. The From Priority value is passed to the iTagPriority parameter into an InTouch integer tag.

Returns an integer error code.

Example
In this example, ToPri is an integer tag that contains the To Priority value, such as 2.

Status = APUGetQueryToPriority(Inst, ToPri);

See Also
APUGetAlarmGroupText(), APUGetConfigurationFilePath(), APUGetPrinterJobCount(), APUGetQueryAlarmState(), APUGetQueryProcessingState(), APUGetQueryToPriority()
Arguments

\textit{iInstance}

The instance of Alarm Printer (0 to 15).

\textit{iPriority}

An integer tag that receives the To Priority value.

Remarks

Another query cannot be running at the same time as the script that includes the APUGetQueryToPriority() function. The To Priority value is written to the iPriority parameter of the function, which is an integer tag.

Returns an integer error code.

Example

The integer tag ToPri receives the To Priority value, such as 999.

\texttt{Status = APUGetQueryToPriority(Inst,ToPri);}

See Also

APUGetAlarmGroupText(), APUGetConfigurationFilePath(), APUGetPrinterJobCount(), APUGetQueryAlarmState(), APUGetQueryFromPriority(), APUGetQueryProcessingState()

\section*{APUGetConfigurationFilePath() Function}

Returns the full file path of the .alc configuration file used for a query.

Category

View

Syntax

\[ \text{[Result=]} \text{APUGetConfigurationFilePath}(iInstance, sTagFilePath) ; \]

Arguments

\textit{iInstance}

The instance of Alarm Printer (0 to 15).

\textit{sTagFilePath}

A message tag to retrieve the name of the file path to the configuration file the Alarm Printer instance is using.

Remarks

The file path text is returned to a message tag that you can specify as sTagFilePath parameter of this function.

Returns an integer error code.

Example

The CfgFilePath message tag receives the file path of the configuration file associated with the Alarm Printer instance contained in the Inst integer tag. For example: c:\MyAlarmCfg\Area1Alarms.alc

\texttt{Status = APUGetConfigurationFilePath(Inst, CfgFilePath);}

See Also

APUGetAlarmGroupText(), APUGetPrinterJobCount(), APUGetQueryAlarmState(), APUGetQueryFromPriority(), APUGetQueryProcessingState(), APUGetQueryToPriority()
APUGetPrinterJobCount() Function

Returns the most recent Windows printer status job count for the printer used by this instance.

**Category**
View

**Syntax**

\[
\text{[Result=] } \text{APUGetPrinterJobCount}(i\text{Instance}, i\text{TagCount});
\]

**Arguments**

- **iInstance**
  The instance of Alarm Printer (0 to 15).

- **iTagCount**
  An integer tag that receives the count value.

**Remarks**

This function returns the count value in the iTagCount parameter, which is an integer tag.

The results are not current unless a query is running. The results are not current unless an alarm has been printed - the job count is typically updated when the printer is initially opened, and then each time an alarm line is printed.

The returned job count value is only valid for Windows printers and does not have much meaning for printers associated with a parallel or serial port.

Returns an integer error code.

**Example**

PJCount is an integer tag that receives the count value from the specified instance.

\[
\text{Status = APUGetPrinterJobCount(Inst, PJCount);}
\]

**See Also**

APUGetAlarmGroupText(), APUGetConfigurationFilePath(), APUGetQueryAlarmState(), APUGetQueryFromPriority(), APUGetQueryProcessingState(), APUGetQueryToPriority()

APUGetQueryAlarmState() Function

Returns the alarm state for the query.

**Category**
View

**Syntax**

\[
\text{[Result=] } \text{APUGetQueryAlarmState}(i\text{Instance}, i\text{TagState });
\]

**Arguments**

- **iInstance**
  The instance of Alarm Printer (0 to 15).

- **iTagState**
  An integer tag that receives the alarm state of the query associated with the specified instance. The value has following meanings:

  0 = All

  1 = Acknowledged

  2 = Unacknowledged
Remarks
The initial alarm state is read from the .alc file. This function returns it in the iTagState parameter of the function which is an integer tag.

Returns an integer error code.

Example
AlmState is an integer tag that contains 0, 1 or 2.
Status = APUGetQueryAlarmState(Inst, AlmState);

See Also
APUGetAlarmGroupText(), APUGetConfigurationFilePath(), APUGetPrinterJobCount(), APUGetQueryFromPriority(), APUGetQueryProcessingState(), APUGetQueryToPriority()

APUGetQueryProcessingState() Function
Returns the status of the alarm query processing.

Category
View

Syntax
[Result=] APUGetQueryProcessingState(iInstance, iTagState);

Arguments
iInstance
The instance of Alarm Printer (0 to 15).

iTagState
An integer tag that receives the processing state from the function. It has following meaning:
0 = Stop
1 = Start

Remarks
This function returns an integer value to the iTagState parameter, which is an integer tag. Returns an integer error code.

Example
ProcState is an integer tag that is set to 0 if the query is not running, or 1 if the query is running.
Status = APUGetQueryProcessingState(Inst, ProcState);

See Also
APUGetAlarmGroupText(), APUGetConfigurationFilePath(), APUGetPrinterJobCount(), APUGetQueryFromPriority(), APUGetQueryProcessingState(), APUGetQueryToPriority()

Querying Instance Information
Use the following functions to return the current status of an instance of the Alarm Printer.

- APUFindAlarmGroupInstance() Function on page 183
- APUFindFileInstance() Function on page 183
- APUFindPrinterInstance() Function on page 184
- APUGetInstanceCount() Function on page 184
• APUIsInstanceUsed() Function on page 185

**APUFindAlarmGroupInstance() Function**

Returns the first instance of the Alarm Printer using the specified alarm group string.

**Category**

View

**Syntax**

```plaintext
[Result=] APUFindAlarmGroupInstance(sGroup, iInstance);
```

**Arguments**

- *sGroup*
  The name of the alarm group to be found among the instances.

- *iInstance*
  An integer tag that receives the value of a found instance that uses the specified group name.

**Remarks**

This function returns the instance number to an integer tag as the iInstance parameter. The initial alarm group string is read from the .alc file. If no instance is found, the function returns 1 as the error code (no instance available) and writes 0 to the integer tag parameter.

Returns an integer error code.

**Example**

FoundInstance is an integer tag that receives the number of the first instance found that uses the $System as its query.

```plaintext
Status = APUFindAlarmGroupInstance("$System", FoundInstance);
```

**See Also**

APUFindFileInstance(), APUFindPrinterInstance(), APUGetInstanceCount(), APUIsInstanceUsed()

**APUFindFileInstance() Function**

Finds the first instance of the Alarm Printer using the specified .alc configuration file.

**Category**

View

**Syntax**

```plaintext
[Result=] APUFindFileInstance(sFilePath,iInstance);
```

**Arguments**

- *sFilePath*
  The path of the .alc configuration file for which the instance is to be found.

- *iInstance*
  An integer tag that receives the number of the instance.

**Remarks**

This function returns the instance number to an integer tag as the iInstance parameter. Use this function to initially obtain the desired instance of the Alarm Printer. The file path string match is not case-sensitive.

If no instance is found, the function returns 1 as the error code (no instance available) and writes 0 to the integer tag parameter.
Returns an integer error code.

**Example**

InstFound is an integer tag that receives the number of the first instance that uses the configuration file c:\MyAlarmCfg\Area1Alarms.alc.

```
Status = APUFindFileInstance("c:\MyAlarmCfg\Area1Alarms.alc", InstFound);
```

**See Also**

APUFindAlarmGroupInstance(), APUFindFileInstance(), APUGetInstanceCount(), APUIsInstanceUsed()

### APUFindPrinterInstance() Function

Finds the first instance of the Alarm Printer using the specified printer name or port.

**Category**

View

**Syntax**

```
[Result=] APUFindPrinterInstance(sPrinter,iInstance);
```

**Arguments**

- **sPrinter**
  
  The name of the printer for which the instance is to be found.

- **iInstance**
  
  An integer tag that receives the number of the instance.

**Remarks**

This function returns the instance number to an integer tag as the iInstance parameter. Use this function to initially obtain the desired instance of an Alarm Printer. The printer name is stored and read from the .alc file. The printer name string match is not case-sensitive. If no instance is found, the function returns 1 as the error code (no instance available) and writes 0 to the integer tag parameter.

Returns an integer error code.

**Example**

FoundInst is an integer tag that receives the number of the first instance that uses LPT1 as printer name in its associated .alc file.

```
Status = APUFindPrinterInstance("LPT1", FoundInst);
```

**See Also**

APUFindAlarmGroupInstance(), APUFindFileInstance(), APUGetInstanceCount(), APUIsInstanceUsed()

### APUGetInstanceCount() Function

Returns the number of running instances of the Alarm Printer, up to a maximum of 16 instances.

**Category**

View

**Syntax**

```
[Result=] APUGetInstanceCount(iCount);
```
Arguments

*iCount*
An integer tag that receives the number of instances.

Remarks

This function returns the number of instances to an integer tag as parameter. Any instances beyond the first sixteen running simultaneously are not dynamically controlled nor can their status be obtained.

Returns an integer error code.

Example

*iCount* is an integer tag. A run-time value of 7 means that there are currently seven instances of Alarm Printer running.

\[ \text{Status = APUGetInstanceCount( iCount );} \]

See Also

APUFindAlarmGroupInstance(), APUFindFileInstance(), APUFindPrinterInstance(), APUIsInstanceUsed()

APUIsInstanceUsed() Function

Returns a discrete value that indicates the instance is currently in use.

Category
View

Syntax

\[ \text{[Result=} \text{APUIsInstanceUsed(} i\text{Instance})]; \]

Arguments

*iInstance*
The number of an instance of Alarm Printer (0 to 15).

Remarks

The result is either 0 or 1:

- 0 = instance is not used.
- 1 = instance is used.

Example

*InUse* is a discrete tag that is set to true (1), if instance 5 is in use, or set to false (0), if instance 5 is not in use.

\[ \text{InUse = APUIsInstanceUsed(5);} \]

See Also

APUFindAlarmGroupInstance(), APUFindFileInstance(), APUFindPrinterInstance(), APUGetInstanceCount()

Querying Printer Information

Use the following functions to return the status of the Alarm Printer.

- *APUGetPrinterName() Function* on page 186
- *APUGetPrinterStatus() Function* on page 186
**APUGetPrinterName() Function**

Returns the Windows printer name or port name of the printer used by this instance.

**Category**

View

**Syntax**

```
[Result=} APUGetPrinterName(iInstance, sTagPrinter);
```

**Arguments**

- **iInstance**
  The number of the Alarm Printer instance (0 to 15).

- **sTagPrinter**
  A message tag that receives the printer name or port name of the configuration associated with the specified instance.

**Remarks**

This function returns the value NONE if no printer is configured for an instance. The printer name is stored and read from the .alc file. This function returns the printer name or port name to a message tag as the sTagPrinter parameter.

Returns an integer error code.

**Example**

PrtName is a message tag that receives the printer name or port name of the configuration associated with instance 3 of Alarm Printer.

```
Status = APUGetPrinterName(3,PrtName);
```

**See Also**

APUGetPrinterStatus()

**APUGetPrinterStatus() Function**

Returns the most recent status of the Windows printer used by this instance.

**Category**

View

**Syntax**

```
[Result=} APUGetPrinterStatus(iInstance,iSelector, iTagStatus);
```

**Arguments**

- **iInstance**
  The instance of Alarm Printer (0 to 15).

- **iSelector**
  An integer value specifying the following:
  
  0 = Get status for Alarm Printer Error
  
  1 = Get status for Alarm Printer No Paper
  
  2 = Get status for Alarm Printer Offline
  
  3 = Get status for Alarm Printer Overflow
iTagStatus
An integer or real tag that receives the status of the printer associated with specified instance number and the type of selection made by the iSelector parameter.

Remarks
This function returns the printer status to an integer or real tag as the iTagStatus parameter. The results are not current unless a query is running and an alarm has been printed. The status typically updates when the printer initially opens, and then each time an alarm line prints.

This status information is being queried to the printer based on Microsoft or Windows driver standards. Not all printer manufacturers follow these standards. Therefore, not all printers return status information. Returns an integer error code.

Example
PrtStat is an integer tag that receives the "Printer Offline" status from the printer associated with instance 5.

\[
\text{Status} = \text{APUGetPrinterStatus}(5, 2, \text{PrtStat});
\]

See Also
APUGetPrinterName()

Setting Alarm Query Information
Use the following functions to set parameters used in the Alarm Printer query.

- APUSetAlarmGroupText() Function on page 187
- APUSetQueryAlarmState() Function on page 188
- APUSetQueryFromPriority() Function on page 188
- APUSetQueryToPriority() Function
- APUSetTimeoutValues() Function on page 189

APUSetAlarmGroupText() Function
Sets the Alarm Query alarm group text.

Category
View

Syntax
\[
[\text{Result=}] \text{APUSetAlarmGroupText}(i\text{Instance}, s\text{Group});
\]

Arguments
- iInstance
  The instance of Alarm Printer (0 to 15).
- sGroup
  Alarm group text.

Remarks
A query cannot be running for this function to succeed.

Returns an integer error code.

Example
This example sets the query of the Alarm Printer instance 1 to \InTouch\GroupA.
Printing Alarms

InTouch HMI Alarms and Events Guide

Status = APUSetAlarmGroupText(1, "\intouch\!GroupA");

See Also
APUSetQueryAlarmState(), APUSetQueryFromPriority(), APUSetQueryToPriority(), APUSetTimeoutValues()

APUSetQueryAlarmState() Function
Sets the alarm state for the query.

Category
View

Syntax
[Result=] APUSetQueryAlarmState(iInstance, iState);

Arguments

iInstance
The instance of Alarm Printer (0 to 15).

iState
An integer with following possible values:
0 = All
1 = Acknowledged
2 = Unacknowledged

Remarks
A query cannot be running simultaneously while running a script using the APUSetQueryAlarmState() function.

Returns an integer error code.

Example
This example sets the query of the Alarm Printer instance 3 to query for acknowledged alarms only.
Status = APUSetQueryAlarmState(3, 1);

See Also
APUSetAlarmGroupText(), APUSetQueryFromPriority(), APUSetQueryToPriority(), APUSetTimeoutValues()

APUSetQueryFromPriority() Function
Sets the lower boundary or from priority of an alarm query.

Category
View

Syntax
[Result=] APUSetQueryFromPriority(iInstance, iPriority);

Arguments

iInstance
The instance of Alarm Printer (0 to 15).

iPriority
An integer value for the From Priority (1 to 999).
Remarks
A query cannot be running for this function to succeed.
Returns an integer error code.

Example
This example sets the From Priority value of the query associated with the instance value of the Inst integer tag to the value of the FromPri integer tag.

```c
Status = APUSetQueryFromPriority(Inst, FromPri);
```

See Also
APUSetAlarmGroupText(), APUSetQueryAlarmState(), APUSetQueryToPriority(), APUSetTimeoutValues()

APUSetQueryToPriority() Function
Sets the To Priority for the query.

Category
View

Syntax
```c
[Result=] APUSetQueryToPriority(iInstance, iPriority);
```

Arguments
```
iInstance
The instance of Alarm Printer (0 to 15).

iPriority
An integer value for the To Priority in the range of 1 to 999. It should also be set higher than or equal to the From Priority value of the same query of the specified instance.
```

Remarks
The To priority must be equal to or greater than the From priority to set a valid alarm priority range. A script containing the APUSetQueryToPriority() function cannot run at the same time as a query.
Returns an integer error code.

Example
This example sets the To Priority value of the query associated with the instance 0 to 240.

```c
Status = APUSetQueryToPriority(0, 240);
```

See Also
APUSetAlarmGroupText(), APUSetQueryAlarmState(), APUSetQueryFromPriority(), APUSetTimeoutValues()

APUSetTimeoutValues() Function
The APUSetTimeoutValues() function sets time-out intervals in seconds. A time-out interval controls how many errors caused by memory access or failing to obtain valid responses are observed while program is running.

The default memory access time-out is two seconds. The default short response wait time is 10 seconds and the default long response wait time is 20 seconds.

Category
View
**Syntax**

```plaintext
[Result=] APUSetTimeoutValues(iMemory,iShort, iLong);
```

**Arguments**

- `iMemory`
  - Integer - access time out
- `iShort`
  - Short response wait time (integer)
- `iLong`
  - Long response wait time (integer)

**Example**

```plaintext
Status = APUSetTimeoutValues(iMemory,iShort,iLong);
```

**See Also**

APUSetAlarmGroupText(), APUSetQueryAlarmState(), APUSetQueryFromPriority(), APUSetQueryToPriority()

---

**Handling Alarm Printer Errors**

Use the APUSetTranslateErrorCode() function to convert an Alarm Printer error code to an error message.

**APUSetTranslateErrorCode() Function**

Converts an error code returned by one of the APU functions into an English string that briefly describes the error code.

**Category**

View

**Syntax**

```plaintext
[Result=] APUSetTranslateErrorCode(iErrorCode,sTagMessage);
```

**Arguments**

- `iErrorCode`
  - An integer error code, normally returned by most other APU functions.
- `sTagMessage`
  - A message tag that receives the error message.

**Remarks**

This function returns the error message to a message tag as sTagMessage parameter. This function can fail if an unknown error code is passed.

Returns an integer error code.

**Example**

This example sets the message tag errmsg to "No instance available." if there is no instance 15 of Alarm Printer currently running.

```plaintext
Status = APUSetTranslateErrorCode(APUSetAlarmGroupText(15,"$system"), ErrMsg);
```

About Recording Alarms into an Alarm Database

The InTouch Distributed Alarm system includes the Alarm DB Logger utility that logs alarms and events
to the alarm database.

Alarm DB Logger is an alarm consumer. You configure it with one or more queries to select alarms from
InTouch alarm providers. The alarms selected by the queries are stored in a transient memory cache,
called the Smart Cache. The Alarm DB Logger writes the contents of the Smart Cache to the alarm
database as alarm and event records at a periodic interval.

The Alarm DB Logger can auto-reconnect. When the connection to the database is lost, the logger
checks for the database connection at regular intervals. Logging resumes when the connection to the
alarm database is re-established.

The Alarm DB Logger reports all errors whether running as a service or a normal application to the
ArchestrA Logger.

SQL Server Accounts for Alarm DB Logger Manager

The Alarm DB Logger Manager creates and uses the following accounts in the SQL Server database:

<table>
<thead>
<tr>
<th>Account</th>
<th>Password</th>
</tr>
</thead>
<tbody>
<tr>
<td>wwAdmin</td>
<td>wwadmin</td>
</tr>
<tr>
<td>wwPower</td>
<td>wwpower</td>
</tr>
<tr>
<td>wwUser</td>
<td>wwuser</td>
</tr>
</tbody>
</table>
Using the Alarm DB Logger Manager

Use the Alarm DB Logger Manager to start and stop logging operations. The Alarm DB Logger Manager can start as a service or a normal application.

You configure alarm logging using the Alarm DB Logger configuration wizard, which you start from within the Alarm DB Logger Manager.

The Alarm DB Logger Manager shows the percentage fill of the Smart Cache with alarm records. Alarms are cached when the SQL Server connection is down or when alarms occur faster than Alarm DB Logger can log them to the alarm database.

To open the Alarm DB Logger Manager
1. In the Tools view, expand Applications.
2. Double-click Alarm DB Logger Manager. The Alarm DB Logger Manager appears.

Configuring Alarm Database Logging

To log InTouch alarm and event data to the alarm database, do the following from within the Alarm DB Logger Manager:

- Configure the connection to the alarm database
- Select which alarms to log to the alarm database
- Set the interval to log records to the alarm database
- Select which method to run the Alarm DB Logger

Establishing the Database Connection

You must establish a connection between the Alarm DB Logger and the alarm database.

The Alarm DB Logger works with SQL Server and Windows authentication. The SQL Server installation must be set to mixed mode.

To configure the database connection
1. Open the Alarm DB Logger Manager. Do the following:
   a. In the Tools view, expand Applications.
   b. Double-click Alarm DB Logger Manager.
2. Click **Settings**. The **Alarm DB Logger Manager - Configuration** wizard appears.

   ![Configuration Wizard](image)

   - **SQL Server/MSDE**
     - **Authentication**: Select the authentication method: SQL Server Authentication or Windows Authentication (default).
     - **Server Name**: Enter the node name of the computer where the alarm database is installed.
     - **Database**: Type the name of the InTouch alarm database.
     - **User Name** and **Password**: Type the user account name and password associated with the alarm database user account.

   - **User info**
   - **Logging Mode**
     - **Detailed**
     - **Consolidated**

   - **Test Connection**
   - **Create**
   - **Delete Database**

3. Configure the database connection. Do the following:
   a. In the **Authentication** list, select the authentication method: SQL Server Authentication or Windows Authentication (default).

   **Note**: When you switch from Windows Authentication to SQL Authentication, a pop up dialog will appear with a recommendation to use Windows Authentication for better application security. To proceed with SQL Authentication, click **OK**.

   A similar message is also logged in the SMC Log Viewer.

   b. In the **Server Name** box, enter the node name of the computer where the alarm database is installed.

   c. In the **Database** box, type the name of the InTouch alarm database.

   d. In the **User Name** box, type the user account name created for the alarm database.

   e. In the **Password** box, type the password associated with the alarm database user account.

   **Note**: The Windows Authentication method uses the credentials of the user currently logged in, and disables the user name and password fields.

4. In the **Logging Mode** area, configure how records are stored. Do either of the following:
   a. Click **Detailed** to store a separate record for each alarm condition (in alarm, acknowledged, and returned to normal).

   b. Click **Consolidated** to store all states of an alarm (in alarm, acknowledged, and returned to normal) in a single record with time stamps for each transition.
5. Click **Create** to create the database, if required.
6. Click **Test Connection** to verify connectivity to the alarm database. A message indicates a successful connection to the database.
7. Click Next to configure which alarms to log. See **Configuring Which Alarms to Log** on page 194 for detailed instructions.

**Configuring Which Alarms to Log**

In the second page of the Alarm DB Logger Manager configuration wizard, you define one or more queries to select alarms from InTouch or Galaxy alarm providers. You also select a range of alarm priority values that are part of the database query.

Use the following query syntax for remote nodes:

```
\NodeName\Provider\AlarmGroup
```

Use the following query syntax for the local node:

```
\Provider\AlarmGroup
```

**Example:**

```
\ProdSvr\InTouch\$System
```

The following is an example of using a Galaxy alarm provider. This query gives you all alarms from a specific area.

```
\Galaxy\Area
```

**To configure which alarms to log**

1. Open the Alarm DB Logger Manager and start the configuration wizard. Do the following:
   a. In the **Tools** view, expand **Applications**.
   b. Double-click **Alarm DB Logger Manager**.
   c. Click **Settings**. The **Alarm DB Logger Manager - Configuration** wizard appears.
2. Click **Next**. The **Alarm DB Logger Manager - Query Selection** page appears.

![Alarm DB Logger Manager - Query Selection](image)

The read-only **Alarm State** box shows the alarm state for logging. The read-only **Query Type** box shows the type of query.

3. In the From Priority box, enter the starting value of the alarm priority range.
4. In the To Priority box, enter the ending value of the alarm priority range.
5. In the Alarm Query box, type the alarm queries that you want to use to store or retrieve data from the alarm database.
6. Click **Next** to configure the logging interval. See *Configuring the Logging Interval* on page 195.

**Configuring the Logging Interval**

In the third page of the Alarm DB Logger Manager configuration wizard, you configure advanced query settings. You can log events to the alarm database. You can also tune the performance of alarm logging by setting the frequency at which the alarm records are written from internal alarm memory to the database.

The logging interval is not the same as the reconnect rate for the SQL Server. The logging interval is the interval at which alarms should be read. The reconnect rate depends on the time out for a connection attempt associated with the SQL Server.

Setting the logging interval too low impacts system performance.

**To configure the logging interval**

1. Open the Alarm DB Logger Manager and start the configuration wizard. Do the following:
   a. In the **Tools** view, expand **Applications**.
   b. Double-click **Alarm DB Logger Manager**.
   c. Click **Settings**. The **Alarm DB Logger Manager - Configuration** wizard appears.

2. Click **Next**. The **Alarm DB Logger Manager - Query Selection** page appears.
3. Click Next. The **Alarm DB Logger Manager - Advanced Setting** page appears.

![Image of the Alarm DB Logger Manager - Advanced Setting page]

4. Select the Log Events check box if you want to store InTouch event records to the alarm database. You can also store events coming from an ArchestrA Galaxy.

5. In the Performance Tuning area, type the interval in milliseconds at which alarm records are written to the alarm database.

6. Click Finish.

**Configuring Alarm DB Logger as a Service**

You can configure the Alarm DB Logger to run as a Windows service. To reduce the security exposure of running the Alarm DB Logger with administrator privileges, the user account permissions have been set to non-interactive to run the Alarm DB Logger as a service.

1. Log in to the computer as an administrator.

2. Open the Alarm DB Logger Manager and start the configuration wizard. Do the following:
   a. In the Tools view, expand Applications.
   b. Double-click Alarm DB Logger Manager.
   c. Click Settings. The **Alarm DB Logger Manager - Configuration** wizard appears.

3. Click Next. The **Alarm DB Logger Manager - Query Selection** page appears.
4. Click **Next**. The **Alarm DB Logger Manager - Advanced Setting** page appears.

5. In the **Running Logger As** area, click either **Normal Application** or **Windows Service**.
   The credentials will depend on the authentication method selected in the **Alarm DB Logger Manager - Configuration** wizard page.

6. In the **Log on as** area, select the login account based on the following criteria, and click **Finish**.

<table>
<thead>
<tr>
<th>Authentication Method</th>
<th>Running Logger As</th>
<th>Log on as</th>
<th>User Name</th>
<th>Password</th>
</tr>
</thead>
<tbody>
<tr>
<td>SQL Server Authentication</td>
<td>Windows Service</td>
<td>Local System account</td>
<td>--</td>
<td>--</td>
</tr>
<tr>
<td>Windows Authentication</td>
<td>Windows Service</td>
<td>Local System Account</td>
<td>--</td>
<td>--</td>
</tr>
<tr>
<td></td>
<td></td>
<td>This account: MAGELLANDEV2000\wwuser</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

By default, selecting **This account** will display the user name of the user currently logged in, in which case password is not required. If you change the user name then you must provide a password.

You must provide a user account with appropriate permissions, to complete the configuration.

The next time you launch the Alarm DB Logger it will pre-fill the configuration details.

**Starting and Stopping Alarm Database Logging**

The Alarm DB Logger writes records to the alarm database. It starts and runs either as a service or a normal application (depending upon the running mode you select when you configure the Alarm DB Logger).
To start or stop alarm logging
1. In the Tools view, expand Applications.
2. Double-click Alarm DB Logger Manager. The Alarm DB Logger Manager appears.

The Smart Cache Status shows the percentage of the in-memory cache holding alarm records.
3. Click Start to begin the alarm logging process.
4. Click Stop to end the alarm logging process.

Alarm Database Views
You can use a set of SQL Server database views to easily query past and current alarm and event occurrences.
A database view is a single logical table that combines information from multiple, underlying database tables. Database views are often called as virtual database tables because they can be queried using standard SQL statements, just as if they were real tables. When a view is queried, it returns a set of records (or rows). Each row has several columns of information that contain the data for the record.
You can use the alarm database views to perform complex queries. For example, you can retrieve alarm records for all HiHi alarms that occurred during a particular time span in a particular area of the plant. Or, you can retrieve all data change events logged by a certain alarm provider node.

All strings are Unicode in the views.

Alarm History View
The v_AlarmHistory view contains all historical alarms and alarm transition events that occurred over a selected time range. The query specifies start and end date and time (the EventStamp or EventStampUTC column). The returned records include alarm origination, alarm acknowledge, alarm enable, alarm disable, and alarm return-to-normal events.

The following table describes the view columns:

<table>
<thead>
<tr>
<th>Column Name</th>
<th>Datatype</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>EventStamp</td>
<td>Datetime</td>
<td>Date and time of alarm event (in local time of database).</td>
</tr>
<tr>
<td>AlarmState</td>
<td>nChar</td>
<td>State of alarm: one of UNACK, UNACK_RTN, ACK, ACK_RTN.</td>
</tr>
<tr>
<td>TagName</td>
<td>nChar</td>
<td>Name of the object that generated the alarm, such as TIC101.</td>
</tr>
<tr>
<td>Description</td>
<td>nVarchar</td>
<td>Description string of the alarm. Can default to object description (or comment in the InTouch HMI). Or acknowledge comment for acknowledged records.</td>
</tr>
<tr>
<td>Area</td>
<td>nChar</td>
<td>Name of the Area or Group for the alarm.</td>
</tr>
</tbody>
</table>
### Column Name | Datatype | Description
--- | --- | ---
Type | nChar | Type of alarm, such as Hi, HiHi, ROC, PV.HiAlarm.
Value | nChar | Value of alarm variable at time of alarm.
CheckValue | nChar | Value of alarm limit at time of alarm.
Priority | Integer | Alarm priority.
Category | nChar | Alarm class or alarm category. Such as Value, Dev, ROC, Process, Batch, System, and so on.
Provider | nChar | Provider of alarm: node/InTouch, or GalaxyName.
Operator | nChar | Name of the operator.
DomainName | nChar | Name of the domain.
UserFullName | nChar | Full name of user in operator (for example, Joseph P. Smith).
UNACKDuration | Float | The time between the most recent alarm transition (alarm or sub-state) and the acknowledgement, if any.
User1 | Float | User-defined field number 1.
User2 | Float | User-defined field number 2.
User 3 | nChar | User-defined field, string.
EventStampUTC | DateTime | UTC date/time of alarm event.
Millisec | Small Int | Fractional seconds for event stamp in increments of 0.1 msec.
OperatorNode | nvarchar(32) | Name of the node where the operator acknowledged the alarm.

The `v_AlarmHistory2` view is a variation of the `v_AlarmHistory` view.

### Column Name | Datatype | Description
--- | --- | ---
EventStamp | Datetime | Date and time of alarm event (in local time of database).
AlarmState | nChar | State of alarm: one of UNACK, UNACK_RTN, ACK, ACK_RTN, ACK_ALM, UNACK_ALM
TagName | nChar | Name of the object that generated the alarm, such as TIC101.
Description | nVarchar | Description string of the alarm. Can default to object description (or comment in InTouch). Or acknowledge comment for acknowledgement records.
Area | nChar | Name of the Area or Group for the alarm.
### Recording Alarms into an Alarm Database

<td>Fractional seconds for event stamp in increments of 0.1 msec.</td>
</tr>
</tbody>
</table>

#### Example Query - Alarm History View

This example selects all records from the Alarm History view:

```sql
SELECT * FROM v_AlarmHistory
```

This example selects all records from the Alarm History view with a priority greater than 100:

```sql
SELECT * FROM v_AlarmHistory WHERE Priority > 100
```

#### Event History View

The v_EventHistory database view lists all historical events that occurred over a selected time range. The query client specifies the starting and ending date and time range. The returned records include all non-alarm events.

<table>
<thead>
<tr>
<th>Column Name</th>
<th>Datatype</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>EventStamp</td>
<td>Datetime</td>
<td>Date and time of event.</td>
</tr>
<tr>
<td>TagName</td>
<td>nChar</td>
<td>Name of the object that generated the event, such as Pump1.</td>
</tr>
</tbody>
</table>
### Column Name | Datatype | Description
--- | --- | ---
Description | nVarChar | Description string of the event. Can default to object description, or comment in InTouch.
Area | nChar | Name of the Area or Group for the event.
Type | nChar | Type of event, such as "Operator data change", "Startup", and so on.
Value | nChar | New Value (if any).
CheckValue | nChar | Old Value (if any).
Category | nChar | Event category or class, such as Value, Process, Batch, System, and so on.
Provider | nChar | Generator of event, such as node/InTouch, or View Engine name for user change.
Operator | nChar | Name of operator 1: JoeR (if any).
DomainName | nChar | Name of domain.
UserFullName | nChar | Full name of user in operator (for example, Joseph P. Smith).
User1 | Float | User-defined field number 1.
User2 | Float | User-defined field number 2.
User 3 | nChar | User-defined field, string.
EventStampUTC | DateTime | UTC date/time of event.
Millisec | Small Int | Fractional seconds for event stamp in increments of 0.1 msec.

### Alarm Event History View

The v_AlarmEventHistory database view provides a historical list of all events and alarms that occurred over a selected time range. The query client specifies start and end date and time. The returned records include all alarms and events. This view combines the alarm view and event view into one and represents the union of the records from those views.

<table>
<thead>
<tr>
<th>Column Name</th>
<th>Datatype</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>EventStamp</td>
<td>Datetime</td>
<td>Date and time of event.</td>
</tr>
<tr>
<td>AlarmState</td>
<td>nChar</td>
<td>State of alarm: one of UNACK, UNACK_RTN, ACK, ACK_RTN. Does not apply for events.</td>
</tr>
<tr>
<td>TagName</td>
<td>nChar</td>
<td>Name of the object that generated the alarm, such as TIC101.</td>
</tr>
</tbody>
</table>
### Recording Alarms into an Alarm Database

Example Query - Alarm Event History View

The following example selects the data in the TagName, Area and Type columns for all records that have a tagname of MyTag1, an alarm state of ACK_RTN or ACK. The results are ordered by the alarm provider.

```
SELECT TagName, Area, Type FROM v_AlarmEventHistory
WHERE TagName='MyTag1'
    AND (AlarmState='ACK_RTN' OR AlarmState='ACK')
ORDER BY Provider
```
Alarm Database Stored Procedures

You can use a set of SQL Server stored procedures to easily retrieve information for analysis and reporting of alarms and events.

A stored procedure is a collection of SQL statements that perform a specific function and return data from the database. Stored procedures can accept input parameters that govern how they are to operate, and they return data in the form of a result set.

The returned results are a set of records and appear as a SQL record set very similar to a SQL Server database view. Stored procedures can improve performance because they exist in the database with their embedded SQL statements and reduce round-trips back to the client.

For more information about stored procedures, including how to view the definitions for them, see your Microsoft SQL Server documentation.

Calling a Stored Procedure

Call a stored procedure using the EXECUTE statement.

EXECUTE sp_AlarmCounter @StartDate='2007-01-01', @EndDate='2007-03-31',
@TagName = 'tag1', @Type = 'LO', @Provider = 'WW21353\InTouch', @Comment = 'SSAADD'

In this example, the StartDate and EndDate parameters are required. The remaining parameters are optional. If you do not provide a value for a parameter, it is not used to filter the result set.

If a stored procedure includes a date/time variable, you can use any valid format specified in the SQL Server documentation.

AlarmCounter Database Stored Procedure

This stored procedure returns the number of times a unique alarm occurred in a time interval. A unique alarm is identified by its TagName, Provider, Alarm Type, and Category.

The counter only applies to the number of alarm originations (not transitions such as acknowledges or returns-to-normal). So, for example, if an alarm occurred and then was acknowledged and then returned to normal, the count for that alarm is only 1 (not 3).

The query must specify the starting and ending date and time. It has five optional parameters: TagName, Class, Type, Provider and Comment.

An example question answered by this view: How many times did object TIC101 (TagName) on provider Node1\InTouch (Provider) go into a Value alarm (Category) that was HiHi (Type) during a time span?

Note: The AlarmCounter stored procedure applies only to the Detailed logging mode and is not supported by Consolidated logging.

<table>
<thead>
<tr>
<th>Column Name</th>
<th>Datatype</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>TagName</td>
<td>Nchar</td>
<td>Name of the object that generated the alarm, such as TIC101.</td>
</tr>
<tr>
<td>GroupName</td>
<td>Nchar</td>
<td>Name of the area or group for the alarm</td>
</tr>
<tr>
<td>AlarmType</td>
<td>Nchar</td>
<td>Type of alarm such as Hi, HiHi, ROC, PV, HiAlarm.</td>
</tr>
<tr>
<td>AlarmClass</td>
<td>Nchar</td>
<td>Alarm class or alarm category such, as Value, Process, Batch, etc.</td>
</tr>
</tbody>
</table>
Recording Alarms into an Alarm Database

InTouch HMI Alarms and Events Guide

<table>
<thead>
<tr>
<th>Column Name</th>
<th>Datatype</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>AlarmCount</td>
<td>Integer</td>
<td>Number of onsets of the alarm during the time range. If an alarm occurs prior to the starting date and time, it is not included in the count.</td>
</tr>
<tr>
<td>Priority</td>
<td>Integer</td>
<td>Alarm priority.</td>
</tr>
<tr>
<td>Provider</td>
<td>Nchar</td>
<td>Provider of alarm, such as node/InTouch, or GalaxyName.</td>
</tr>
<tr>
<td>Comment</td>
<td>Nchar</td>
<td>The alarm comment.</td>
</tr>
</tbody>
</table>

An example query is:
EXECUTE sp_AlarmCounter @StartDate='2007-01-01 23:23:23', @EndDate='2007-03-31 23:23:23', @Tagname = '$NewAlarm'

EventCounter Database Stored Procedure

This database stored procedure provides the count of the number of events of a certain type on a certain tag that occurred in a time interval. The query client must specify start and end date and time. It has three optional parameters: TagName, Provider and Comment. The counter applies only to non-alarm events. The purpose of this view is to show frequency of each event. For example, how many times did the pump turn on? The TagName, Provider, Category and Type are used to uniquely identify an event and do the counting.

<table>
<thead>
<tr>
<th>Column Name</th>
<th>Datatype</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>TagName</td>
<td>NChar</td>
<td>Name of the object that generated the alarm, such as TIC101</td>

<tr>
<td>Area</td>
<td>NChar</td>
<td>Name of the Area or Group for the alarm.</td>
</tr>
<tr>
<td>Type</td>
<td>NChar</td>
<td>Type of event.</td>
</tr>
<tr>
<td>Category</td>
<td>NChar</td>
<td>Alarm class or alarm category, such as Value, Process, Batch, etc.</td>
</tr>
<tr>
<td>EventCount</td>
<td>Integer</td>
<td>Number of times the event of this Type for the TagName has occurred in the specified time range.</td>
</tr>
<tr>
<td>Provider</td>
<td>NChar</td>
<td>Provider of event: node/InTouch, or GalaxyName.</td>
</tr>
<tr>
<td>Comment</td>
<td>NChar</td>
<td>The event comment.</td>
</tr>
</tbody>
</table>

An example query is:
EXECUTE sp_EventCounter @StartDate='2007-01-01 23:23:23', @EndDate='2007-03-31 23:23:23', @Tagname = '$NewAlarm'
CHAPTER 10

Viewing Recorded Alarms

In This Chapter

About Viewing Recorded Alarms ................................................................. 207
Configuring the Alarm DB View Control .................................................. 207
Using an Alarm DB View Control at Run Time ........................................... 223
Using Alarm DB View ActiveX Properties ................................................ 224
Using Alarm DB View ActiveX Methods .................................................... 247
Handling Errors With Using Methods and Properties ............................... 252
Using Alarm DB View ActiveX Events to Trigger Scripts ............................ 252

About Viewing Recorded Alarms

You use the Alarm DB View ActiveX control to visualize data from the alarm database. Use this control to show all alarm and event information generated from an InTouch application during run time.

For this control, you can configure:

- Context sensitive menu features
- Display mode
- List control options
- Colors for different properties
- Font type, style and size
- Database specifications (server name, user ID and password)
- Query filters
- Column management
- Sorting

Run-time users can change options while the application is running to select the data they are viewing. They can:

- Sort the information within a column
- Update the display
- Perform a query
- Resize the width of a column

For more information about ActiveX controls, see ActiveX Controls in the InTouch® HMI Visualization Guide.

Configuring the Alarm DB View Control

When you configure the Alarm DB View control, you:

- Configure the connection to the alarm database.
- Configure the appearance of the grid.
- Select a display font.
- Configure the visual appearance.
- Set which features the user can access while the application is running.
- Configure which alarms to show.
- Create custom filters.
- Set the colors for the types of alarm records.
- Configure the time formats as shown.
- Configure the sort order of alarm records shown.

**Connecting the Alarm DB View to the Alarm Database**

You must configure the connection between the Alarm DB View control and the alarm database.

Use an account with appropriate read-only access to the alarm database and not a system administrator account.

**To configure the connection to the alarm database**

1. Right-click the Alarm DB View control and then click **Properties**. The *AlmDbViewCtrl Properties* dialog box appears.
2. Click the **Database** tab.

3. Configure the connection to the alarm database. Do the following:
   a. In the **Authentication** list, select the authentication method: SQL Server Authentication or Windows Authentication (default).
Note: When you switch from Windows Authentication to SQL Authentication, a pop up dialog will appear with a recommendation to use Windows Authentication for better application security. To proceed with SQL Authentication, click OK.

A similar message is also logged in the SMC Log Viewer.

b. In the Server Name box, enter the node name of the computer where the alarm database is installed.

c. In the Database Name box, type the database name.

d. In the User box, type the name of a valid user account.

e. In the Password box, type the password associated with the user account.

Note: The Windows Authentication method uses the credentials of the user currently logged in, and disables the user name and password fields.

4. Select the Auto Connect check box to have the Alarm DB View control automatically connect to the alarm database when the InTouch application starts running.

If you do not select the Auto Connect check box, you must configure the Alarm DB View control to connect to the alarm database by explicitly calling the Connect() method. For more information about the Connect method, see Connect() on page 248.

5. Click Test Connection to verify connectivity to the alarm database. A message indicates a successful connection.

6. Click Apply.

### Configuring the Appearance Properties of the Grid

You can configure properties that determine the visual appearance of the Alarm DB View control.

**To configure the appearance of the grid**

1. Right-click the Alarm DB View control and then click Properties. The AlmDbViewCtrl Properties dialog box appears.

2. Click the General tab.

3. Configure the general appearance. Do the following:
   - Click the Show Grid check box to show the grid.
   - Click the Silent Mode check box to prevent the control from showing any error messages at run time.
o Click the **Show Message** check box to show a message if the alarm query does not return any records. Type the message to show in the box.

o Click the **Show Heading** check box to show the control heading.

o Click the **Show Status Bar** check box to show the status bar.

4. Click **Apply**.

### Configuring the Display Font

You can select the font of all text that appears in the Alarm DB View control.

**To configure the font properties**

1. Right-click the Alarm DB View control and then click **Properties**. The **AlmDbViewCtrl Properties** dialog box appears.

2. Click the **General** tab.

![AlmDbViewCtrl Properties dialog box](image)

3. Click Font. The standard Windows **Font** dialog box appears. Configure the font and then click **OK**.

4. Click **Apply**.

### Choosing Alarm or Event Data

You can configure if alarm records, event records, or both appear in an Alarm DB View control.

**To select the type of data**

1. Right-click the Alarm DB View control and then click **Properties**. The **AlmDbViewCtrl Properties** dialog box appears.
2. Click the **General** tab.

   ![Image of AlmDbViewCtrl Properties]

3. In the **Display Mode** list, click the type of historical records from the list:
   a. Click **Alarm & Event History** to show both alarm and event historical database records.
   b. Click **Alarm History** to show only historical alarm records.
   c. Click **Event History** to show only historical event records.

4. Click **Apply**.

**Selecting and Configuring Display Columns**

For the Alarm DB View control, you can:

- Select and order the columns.
- Set the width of a column in pixels.
- Rename a column.

At least one column must be selected.

---

**Important:** The column names are reset to default column names if the display mode is changed. It is better to select the display mode first before changing the column names.

---

**To configure the display column details**

1. Right-click the Alarm DB View control and then click **Properties**. The **AlmDbViewCtrl Properties** dialog box appears.
2. Click the **General** tab.
3. Click **Column Details**. The **Column Details** dialog box appears.

4. In the **Name** column, select the check boxes next to the names of the columns that you want to appear in the Alarm DB View control. You must select at least one column from the list.
### Viewing Recorded Alarms

InTouch HMI Alarms and Events Guide

<table>
<thead>
<tr>
<th>Column Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Time</td>
<td>Shows the time at which the alarm occurred.</td>
</tr>
<tr>
<td>State</td>
<td>Shows the state of the alarm.</td>
</tr>
<tr>
<td>Class</td>
<td>Shows the alarm category.</td>
</tr>
<tr>
<td>Type</td>
<td>Shows the alarm type.</td>
</tr>
<tr>
<td>Priority</td>
<td>Shows the alarm priority.</td>
</tr>
<tr>
<td>Name</td>
<td>Shows the tag or source that caused the alarm or event.</td>
</tr>
<tr>
<td>Group</td>
<td>Shows the alarm group name.</td>
</tr>
<tr>
<td>Provider</td>
<td>Shows the name of the alarm provider.</td>
</tr>
<tr>
<td>Value</td>
<td>Shows the value of the tag when the alarm occurred.</td>
</tr>
<tr>
<td>Limit</td>
<td>Shows the alarm limit value of the tag.</td>
</tr>
<tr>
<td>Operator</td>
<td>Shows the logged-on operator's ID associated with the alarm condition.</td>
</tr>
<tr>
<td>Operator Full Name</td>
<td>Shows the logged-on operator’s full name.</td>
</tr>
<tr>
<td>Operator Node</td>
<td>Shows the logged on operator’s node associated with the alarm condition.</td>
</tr>
<tr>
<td>Operator Domain</td>
<td>Shows the logged on operator’s domain associated with the alarm condition.</td>
</tr>
<tr>
<td>Alarm Comment</td>
<td>Shows the tag’s comments. This comment was typed in the Alarm Comment box when the tag’s alarm was defined in the database. When an acknowledgement comment is introduced for alarms, the new comment is updated in this comment column.</td>
</tr>
<tr>
<td>User1</td>
<td>Shows the numerical values of User Defined Number 1 corresponding to the alarm.</td>
</tr>
<tr>
<td>User2</td>
<td>Shows the numerical values of User Defined Number 2 corresponding to the alarm.</td>
</tr>
<tr>
<td>User3</td>
<td>Shows the string value of the user defined string property associated with the alarm.</td>
</tr>
<tr>
<td>Duration</td>
<td>Shows the unacknowledgement duration or the alarm duration, depending on what has been selected by the operator.</td>
</tr>
<tr>
<td>UTC Time</td>
<td>Shows the time of the alarm in UTC.</td>
</tr>
</tbody>
</table>

In a Terminal Services environment, this is the name of the client computer that the operator established the Terminal Services session from. If the node name can't be retrieved, the node's IP address is used instead.
5. Rearrange columns by selecting the column name and using the up and down arrows. The column name appearing at the top of the Column Details dialog box is the left-most column of the alarm control.

6. To change the name of a column or its width, select the column and click Edit. The Edit dialog box appears.

   ![Edit Dialog Box]

   a. In the New Name box, type the new column name.
   b. In the New Width box, type the column width. The column width can range from 1 to 999 pixels.
   c. Click OK.

7. Click Reset to Default to return to the default column detail settings.

8. Click OK in the Column Details dialog box.

9. Click Apply.

Controlling Which Features You Can Access at Run Time

You can enable and disable the shortcut menu features available at this control.

To configure run-time features

1. Right-click the Alarm DB View control and then click Properties. The AlmDbViewCtrl Properties dialog box appears.

2. Click the General tab.

   ![AlmDbViewCtrl Properties Dialog Box]

3. In the Context-Sensitive Menu Options area, configure which menu commands are available at run time.

   - Select the Enable Refresh Menu check box to enable the Refresh menu option in the shortcut menu of the control at run time. The Refresh menu refreshes the control to the database, and if the connection is successful, it shows the set of records in the range 1 to number defined by the MaxRecords property.
   - Select the Enable Reset Menu check box to enable the Reset menu option in the shortcut menu of the control at run time. The Reset menu arranges all the columns to the settings saved at design time.
• Select the **Enable Sort Menu** check box to enable the Sort menu option on the shortcut menu of the control at run time. This menu shows the **Secondary Sort** menu used to set the user-defined sorting of columns.

• Select the **Enable Filter Menu** check box to enable the Filter menu option on the shortcut menu of the control at run time. This menu shows the filter menu used to set the user-defined filtering criteria.
  1. Click the **Resize Column** check box to allow resizing the columns.
  2. Select the **Row Selection** check box to enable selecting alarm records.
  3. Select the **Retrieve** buttons check box to show the retrieval buttons at the right side of the control.
  4. Click **Apply**.

### Configuring the Shown Time Format and Time Zone for Alarm Records

You can configure the time format and time zone for alarm records shown in the Alarm DB View control.

**To configure time format**

1. Right-click the Alarm DB View control and then click **Properties**. The AlmDBViewCtrl Properties dialog box appears.
2. Click the **Time/Sort** tab.

3. In the **Time Format** list, click a time format:

<table>
<thead>
<tr>
<th>String character</th>
<th>Description</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>d</td>
<td>Two-digit day</td>
<td>31</td>
</tr>
<tr>
<td>b</td>
<td>Three-letter month abbreviation</td>
<td>Aug</td>
</tr>
<tr>
<td>Y</td>
<td>Four-digit year</td>
<td>2007</td>
</tr>
<tr>
<td>m</td>
<td>Two-digit month</td>
<td>11</td>
</tr>
<tr>
<td>/</td>
<td>Date division function</td>
<td>06/2007</td>
</tr>
<tr>
<td>y</td>
<td>Two-digit year</td>
<td>07</td>
</tr>
<tr>
<td>#x</td>
<td>Full day and date</td>
<td>Friday, August 09, 2002</td>
</tr>
<tr>
<td>B</td>
<td>Full month name</td>
<td>September</td>
</tr>
</tbody>
</table>
You can also manually enter your own format string in the list box using custom text and the formatting characters. Some sample time format character strings are shown below:

<table>
<thead>
<tr>
<th>Time Format String</th>
<th>Display</th>
</tr>
</thead>
<tbody>
<tr>
<td>%d %b</td>
<td>09 Aug</td>
</tr>
<tr>
<td>%m/%d/%Y</td>
<td>08/09/2002</td>
</tr>
<tr>
<td>%#x</td>
<td>Friday, August 09, 2002</td>
</tr>
<tr>
<td>%Y-%m-%d</td>
<td>2002-08-09</td>
</tr>
<tr>
<td>%m/%d/%Y %H:%M:%s %p</td>
<td>08/09/2002 16:56:38.07</td>
</tr>
<tr>
<td>%I:%M%p</td>
<td>04:56 PM</td>
</tr>
</tbody>
</table>

4. In the **Displayed Time Zone** list, click the desired time zone:

<table>
<thead>
<tr>
<th>Time Zone</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>GMT</td>
<td>Alarm time stamps use Greenwich Mean Time.</td>
</tr>
<tr>
<td>Local Time</td>
<td>Alarm time stamps are shown with the local time of the client hosting the Alarm DB View control.</td>
</tr>
</tbody>
</table>
**Viewing Recorded Alarms**

InTouch HMI Alarms and Events Guide

<table>
<thead>
<tr>
<th>Time Zone</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Origin Time</td>
<td>Alarm time stamps are shown with the local time of the alarm provider.</td>
</tr>
</tbody>
</table>

5. Click **Apply**.

### Selecting the Time Period of Data from the Alarm Database

You can set query values to select records based on the selected time. You can also configure the maximum number of records to view, the start and end time of the alarm query, and the query time zone.

The number of records retrieved by an alarm database query affects the time required to show the records in the Alarm DB View control. The Alarm DB View control takes approximately 30 seconds to show 50000 records retrieved from the alarm database.

To improve the performance of the Alarm DB View control, reduce the **Maximum Records** value to display records more quickly. Also, you can select a shorter record retrieval interval in the **Duration** field to improve the performance of the Alarm DB View control.

**To select the time period of data**

1. Right-click the Alarm DB View control and then click **Properties**. The **AlmDBViewCtrl Properties** dialog box appears.
2. Click the **Selection** tab.

3. To use a pre-defined time interval that always queries for data using the UTC time zone, click an interval from the **Duration** list.
4. To use a specific start time and end time, click **Use Specific Time** and then configure the details.
   a. In the **Start Time** box, enter the start time to retrieve the alarm records. The string must be in MM/DD/YYYY HH:MM:SS format. Use any date in any time zone from midnight, January 1, 1970, to January 18, 19:14:07, 2038.
   b. In the **End Time** box, enter the end time to stop retrieving alarm records. The string must be in MM/DD/YYYY HH:MM:SS format. Use any date in any time zone from midnight, January 1, 1970, to January 18, 19:14:07, 2038.
   c. In the **Query Time Zone** area, click either **UTC** or **Origin Time**. UTC time is Greenwich Mean Time, also known as Coordinated Universal Time or Zulu. Origin time is the current time in the operator’s time zone.
5. In the **Duration Column** area, configure which type of duration is shown. Duration is measured in milliseconds.
o Click **UnAck Duration** to show the time between the most recent alarm transition (alarm or sub-state) and the acknowledgement, if any.

o Click **Alarm Duration** to show the amount of time elapsed between the initial occurrence of an alarm and the time at which it returned to a normal state.

6. In the **Maximum Records** box, type the number of records to view from the control at one instance. The valid range of maximum records is from 1 to 1000.

7. Click **Apply**.

### About Query Time Zones

The Query Time Zone options are **Origin Time** and **UTC**.

- Origin time is the local time in the operator’s time zone.
- UTC time is Greenwich Mean Time, also known as Coordinated Universal Time or Zulu.

If Use Specific Time is selected, you can select between the two query time zone options. If Use Specific Time is not selected, the selected Duration predefined time interval always queries for data using the UTC time zone.

To avoid problems during the Daylight Saving Time switch, we recommend that you always use UTC in Query Time Zone. If you use Local Time instead, it is possible that alarm records will be missing for the transition period from Daylight Saving Time to Normal Time.

If you are running several different computers with different time zone settings, and they are all logging to the same alarm database, each record will get the time stamps in UTC, plus the time zone offset and daylight saving adjustment needed to convert that time stamp to the corresponding Origin Time. As a result, every entry in the database has two time stamps: the UTC time and the Origin Time from the computer that did the logging. This makes retrievals faster. In the table entries, the UTC time is identified as the “Transition Time” and the Origin Time is identified as the “EventStamp.”

### Creating Custom Filters and Using Filter Favorites

You can select which records are included in your query results. For example, you can select a filter by the date of a record or the state of the alarm. You can select multiple fields to limit or expand your query results.

If you do not define a custom filter, all records are returned.

If you translated strings for language switching, you cannot use those strings as filter criteria. Translated strings are stored outside of the alarm database.

**To create custom filters**

1. Right-click the **Alarm DB View** control and then click **Properties**. The AlmDBViewCtrl Properties dialog box appears.
2. Click the **Query Filter** tab.

3. In the left pane, select filter fields and then click **Add** to include them in the filter, which is shown in the right pane. The filter fields are described in the following table:

<table>
<thead>
<tr>
<th>Field name</th>
<th>Filters query by:</th>
</tr>
</thead>
<tbody>
<tr>
<td>State</td>
<td>Alarm state. For more information, see <em>Values for the State Column</em> on page 221.</td>
</tr>
<tr>
<td>Class</td>
<td>Alarm class.</td>
</tr>
<tr>
<td>Type</td>
<td>Alarm type.</td>
</tr>
<tr>
<td>Priority</td>
<td>Alarm priority.</td>
</tr>
<tr>
<td>Name</td>
<td>Alarm name.</td>
</tr>
<tr>
<td>Group</td>
<td>Alarm group name.</td>
</tr>
<tr>
<td>Provider</td>
<td>Alarm provider.</td>
</tr>
<tr>
<td>Value</td>
<td>Alarm value. Values in the Value column are shown as alphanumeric values. The comparisons of these values in the Query Filter are done as string comparisons.</td>
</tr>
<tr>
<td>Limit</td>
<td>Alarm limit. Values are alphanumeric. The comparisons of these values in the Query Filter are done as a string comparisons.</td>
</tr>
<tr>
<td>Operator</td>
<td>Operator.</td>
</tr>
<tr>
<td>OperatorFullName</td>
<td>Operator’s full name.</td>
</tr>
<tr>
<td>OperatorNode</td>
<td>Operator’s node name associated with the alarm.</td>
</tr>
<tr>
<td>OperatorDomain</td>
<td>Operator’s domain name associated with the alarm.</td>
</tr>
<tr>
<td>Comment</td>
<td>Alarm comment.</td>
</tr>
<tr>
<td>User1</td>
<td>Alarm user-defined numeric value 1.</td>
</tr>
<tr>
<td>User2</td>
<td>Alarm user-defined numeric value 2.</td>
</tr>
</tbody>
</table>
Field name | Filters query by:
---|---
User3 | Alarm user-defined string value.
Duration | Unacknowledgement and alarm duration. A Duration column set equal to zero does not produce records with a null value in the query.

4. To remove a field from the filters pane, click the field you want to delete and click Delete. Deleting a filter cannot be undone. When a message appears, click Yes.

5. Configure the criteria for each filter field. For more information, see Defining the Column Filter Criteria on page 219.

6. Configure the operators and grouping for the filter. For more information, see Grouping Alarm Columns on page 220.

7. Configure the query favorites file. Do the following:
   a. In the Filter Favorites File box, type the network path and file name or click the ellipse button to browse for the file.
   b. To edit the Filter Favorites file, click the Edit Favorites File button. The Filter Favorites window opens, allowing you to add, modify, or delete filters from your favorites file. When you are done, click OK to save your changes and close the window.

8. Click Apply.

**Defining the Column Filter Criteria**

For each column filter you include in the query, you must configure the filter criteria. For example, you might want to only see alarms for a specific operator.

**To define a column filter**

1. Right-click the field and then click Edit Filter. The Dialog dialog box appears.

![Dialog Dialog Box](image)

2. In the Operator list, select the operator you need.

3. In the Value box, type the criteria that must be matched. The Value box does not accept values that cannot be processed for the selected query. The Value box accepts the following wildcard characters when the Like and Not Like filter operators are used for alphanumeric column names:

<table>
<thead>
<tr>
<th>Character</th>
<th>Finds</th>
</tr>
</thead>
<tbody>
<tr>
<td>%</td>
<td>Any string of zero or more characters</td>
</tr>
<tr>
<td>_</td>
<td>Any single character</td>
</tr>
</tbody>
</table>
Character | Finds
---|---
[ ] | Any single character within the specified range, for example [a-f], or within a set, for example [abcdef].

[^] | Any single character not within the specified range, for example [^a-f], or set, for example [^abcdef].

The following Value box limits apply to different fields:

<table>
<thead>
<tr>
<th>Field</th>
<th>Limit</th>
</tr>
</thead>
<tbody>
<tr>
<td>All fields</td>
<td>All alphanumeric characters except User1, User2 and Priority.</td>
</tr>
<tr>
<td>Priority</td>
<td>Accepts integer values from 1 to 999.</td>
</tr>
<tr>
<td>User1, User2</td>
<td>Accepts only negative, positive or fractional numbers.</td>
</tr>
</tbody>
</table>

4. Click **OK**.

**Grouping Alarm Columns**

When more than one field is defined, the columns are combined using Boolean operators.

- The **AND** operator returns records that meet all values of the selected fields.
- The **OR** operator returns records that meet the values of any of the selected fields.

To use AND/OR operators to set the filter selection criteria, the respective fields must be grouped together. Only a single filter expression can be created on an item in the filters pane. If multiple expressions are needed, then the item must be added to the filters pane again.

By default, the grouped fields have the AND operator.

The AND and OR operators are parent nodes. The fields selected under each parent node are child nodes. You cannot drag fields parent nodes to child nodes.

**To group alarm columns**

1. Right-click the field and then click Group.
2. Drag a field onto another field.

**Copying or Moving Query Filters**

If you have more than one instance of Alarm Pareto control and want to use the same filters for multiple instances, you can copy or cut the defined filters from one instance and paste them to another filter.

**To copy filters**

1. Define the filters in the first instance of the Alarm Pareto control.
2. Right-click the filters and click **Copy**. To move the filters, click **Cut**.
3. Close the first instance of the Alarm Pareto control.
4. Open the next instance of the Alarm Pareto control and click the **Query Filter** tab.
5. Position the arrow in the right pane. Right-click on a selected filter and click **Paste**.

**Values for the State Column**

When you add the State column to your filter query, you may assign values from the **Value** menu in the **Define Filter** dialog box. The values available are described in the following table:

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ACK</td>
<td>Produces a query of all system acknowledgements.</td>
</tr>
<tr>
<td>ACK_ALM</td>
<td>Produces a query of all acknowledged alarms.</td>
</tr>
<tr>
<td>UNACK_ALM</td>
<td>Produces a query of all unacknowledged alarms.</td>
</tr>
<tr>
<td>ACK_RTN</td>
<td>Produces a query of all acknowledged alarms that have returned to normal.</td>
</tr>
<tr>
<td>UNACK_RTN</td>
<td>Produces a query of unacknowledged alarms that have returned to normal.</td>
</tr>
<tr>
<td>All UNACK Records</td>
<td>Produces a query of all unacknowledged records.</td>
</tr>
<tr>
<td>All ACK Records</td>
<td>Produces a query of all acknowledgment records.</td>
</tr>
<tr>
<td>All ALM Records</td>
<td>Produces a query of all alarm records.</td>
</tr>
<tr>
<td>All RTN Records</td>
<td>Produces a query of all alarms that have returned to normal.</td>
</tr>
</tbody>
</table>

**Note:** When a tag in expanded summary alarm mode is used to create an alarm, which returns to normal when the main alarm is acknowledged, two records are created. The first record is the "acknowledged and returned to normal" record as the new alarm is already in a returned to normal state. The second record is acknowledged, which corresponds to acknowledging the main alarm. The previous implementation of ACK_ALM has been changed to ACK.

**Configuring Colors for Various Types of Alarm Records**

You can set the colors for alarm and event records.

**To configure alarm display colors**

1. Right-click the Alarm DB View control and then click Properties. The AlmDBViewCtrl Properties dialog box appears.
2. Click the Color tab.

3. Configure the color for each of the following by clicking the color box to open the palette.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Alarm Return Forecolor</td>
<td>Sets the foreground color of records for alarms that return to normal.</td>
</tr>
<tr>
<td>Alarm Return Backcolor</td>
<td>Sets the background color of records for alarms that return to normal.</td>
</tr>
<tr>
<td>Event Forecolor</td>
<td>Sets the foreground color of events records</td>
</tr>
<tr>
<td>Event Backcolor</td>
<td>Sets the background color of events records</td>
</tr>
</tbody>
</table>

4. In the Alarm Priority boxes, type the breakpoint values for the alarm display. You can assign breakpoint values so that alarms will appear in different colors depending on the Alarm Priority. The default minimum and maximum alarm priority values are 1 and 999, respectively. For example, you set the Unack Alm Forecolor to be orange for the priority range of 250 to 499 and red for the priority range of 1 to 249. If an alarm occurs with a priority of 254, it is shown in an orange font. If an alarm occurs with a priority of 12, it is shown in a red font.

5. Configure the color for each of the following by clicking the color box to open the palette.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Unack Alm Forecolor</td>
<td>Sets the foreground color for each color priority range for unacknowledged alarms.</td>
</tr>
<tr>
<td>Unack Alm Backcolor</td>
<td>Sets the background color for each color priority range for unacknowledged alarms.</td>
</tr>
<tr>
<td>Ack Alm Forecolor</td>
<td>Sets the foreground color for each color priority range for acknowledged alarms.</td>
</tr>
<tr>
<td>Ack Alm Backcolor</td>
<td>Sets the background color for each color priority range for acknowledged alarms.</td>
</tr>
</tbody>
</table>

6. Click Apply.
Configuring the Sort Order for Alarm Records

You can control the way the alarm records are sorted in the control.

1. Right-click the Alarm DB View control and then click Properties. The AlmDBViewCtrl Properties dialog box appears.

2. Click the Time/Sort tab.

3. In the Primary Sort Column list, click the name of the primary sort column. Only visible columns appear in the Sort Column list. If you do not see the column you want, click the General tab and select the column from Column Details.

4. In the Secondary Sort Column list, click the name of the secondary sort column.

5. Select Ascending or Descending as the sort direction.

6. Click OK.

Using an Alarm DB View Control at Run Time

Depending on how the control is configured, you can:

- Retrieve and refresh the data.
- Sort the data.
- Filter the data.
- Select rows.
- Change the column order by dragging them.
- Reset all the columns to the settings saved at design time.

Sorting Records

You can sort records in the display. Click on the heading to sort all the rows.

Right-click in the control and click Sort to open the Secondary Sort dialog box, where you can do single and multiple column sorting, in ascending or descending order.

To specify the columns to be sorted, select the check box beside the column name. Use the Sort Order arrow keys to rearrange the columns.

If multiple alarm events have the same time stamp, they may not appear in the expected order.

For example, if the desired sorting is in descending order based on the alarm state first, then:

1. Select both the Date and State check boxes.
2. Select the **State** row.
3. Click the up sort order arrow.
4. In the Sort Type area, click **Descending**.
5. Click **OK**.

**Understanding Status Bar Information**

The status bar shows the current status of the control.
- The left frame shows the server name and the database connected.
- The middle frame shows the number of the records that is shown out of the total number of records that is returned by the query.
- The right side of the frame shows the connection status with the server.

**Using Alarm DB View ActiveX Properties**

You can set the value an Alarm DB View control property directly using a script or you can assign it to an InTouch tag or I/O reference. For more information about setting properties, see Scripting ActiveX Controls in the InTouch® HMI Scripting and Logic Guide.

For more information on setting color values, see *Configuring Colors for ActiveX Controls* on page 65.

**AckAlmBackColor Property**

Gets or sets the acknowledged alarm background color. This setting overrides the individual range color settings for acknowledged alarms (AckAlmBackColorRange1 to AckAlmBackColorRange4).

<table>
<thead>
<tr>
<th>Type</th>
<th>Integer</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default</td>
<td>White</td>
</tr>
</tbody>
</table>

**Syntax**

```
Object.AckAlmBackColor [= color]
```

**Value**

- `color`
  - A value or constant that determines the color of the background.

**AckAlmBackColorRange1 Property**

Gets or sets the acknowledged alarm background color. This color applies to the records shown in the control with state ACK_ALM with priorities in the range 1 to ColorPriorityRange1.

<table>
<thead>
<tr>
<th>Type</th>
<th>Integer</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default</td>
<td>White</td>
</tr>
</tbody>
</table>

**Syntax**

```
Object.AckAlmBackColorRange1 [= color]
```
Value

\textit{color}

A value or constant that determines the color of the background.

**AckAlmBackColorRange2 Property**

Gets or sets the acknowledged alarm background color. This color applies to the records shown in the control with state ACK_ALM with priorities in the range ColorPriorityRange1 to ColorPriorityRange2.

**Type**

Integer

**Default**

White

**Syntax**

\texttt{Object.AckAlmBackColorRange2 [= color]}

**Value**

\textit{color}

A value or constant that determines the color of the background.

**AckAlmBackColorRange3 Property**

Gets or sets the acknowledged alarm background color. This color applies to the records shown in the control with state ACK_ALM with priorities in the range ColorPriorityRange2 to ColorPriorityRange3.

**Type**

Integer

**Default**

White

**Syntax**

\texttt{Object.AckAlmBackColorRange3 [= color]}

**Value**

\textit{color}

A value or constant that determines the color of the background.

**AckAlmBackColorRange4 Property**

Gets or sets the acknowledged alarm background color. This color applies to the records shown in the control with state ACK_ALM with priorities in the range ColorPriorityRange3 to 999.

**Type**

Integer

**Default**

White

**Syntax**

\texttt{Object.AckAlmBackColorRange4 [= color]}
**Value**

`color`

A value or constant that determines the color of the background.

**AckAlmForeColor Property**

Gets or sets the acknowledged alarm foreground color. This setting overrides the individual range color settings for acknowledged alarms (AckAlmForeColorRange1 to AckAlmForeColorRange4).

**Type**

Integer

**Default**

Black

**Syntax**

```
Object.AckAlmForeColor [= color]
```

**Value**

`color`

A value or constant that determines the color of the text.

**AckAlmForeColorRange1 Property**

Gets or sets the acknowledged alarm foreground color. The color applies to the records shown in the control with state ACK_ALM with priorities in the range 1 to ColorPriorityRange1.

**Type**

Integer

**Default**

Black

**Syntax**

```
Object.AckAlmForeColorRange1 [= color]
```

**Value**

`color`

A value or constant that determines the color of the text.

**AckAlmForeColorRange2 Property**

Gets or sets the acknowledged alarm foreground color. The color applies to the records shown in the control with state ACK_ALM with priorities in the range ColorPriorityRange1 to ColorPriorityRange2.

**Type**

Integer

**Default**

Black

**Syntax**

```
Object.AckAlmForeColorRange2 [= color]
```
Value

*color*
A value or constant that determines the color of the text.

**AckAlmForeColorRange3 Property**

Gets or sets the acknowledged alarm foreground color. The color applies to the records shown in the control with state `ACK_ALM` with priorities in the range `ColorPriorityRange2` to `ColorPriorityRange3`.

**Type**
Integer

**Default**
Black

**Syntax**

```plaintext
Object.AckAlmForeColorRange3 [= color]
```

**Value**

*color*
A value or constant that determines the color of the text.

**AckAlmForeColorRange4 Property**

Gets or sets the acknowledged alarm foreground color. The color applies to the records shown in the control with state `ACK_ALM` with priorities in the range `ColorPriorityRange3` to 999.

**Type**
Integer

**Default**
Black

**Syntax**

```plaintext
Object.AckAlmForeColorRange4 [= color]
```

**Value**

*color*
A value or constant that determines the color of the text.

**AckRtnBackColor Property**

Gets or sets the background color of acknowledged alarms that return to normal (ACK_RTN).

**Type**
Integer

**Default**
White

**Syntax**

```plaintext
Object.AckRtnBackColor [= color]
```

**Value**

*color*
A value or constant that determines the color of the background.
**AckRtnForeColor Property**

Gets or sets the text color of acknowledged alarms that return to normal (ACK_RTN).

**Type**

Integer

**Default**

Blue

**Syntax**

```
Object.AckRtnForeColor [= color]
```

**Value**

```
color
```

A value or constant that determines the color of the text.

---

**AlmRtnBackColor Property**

Gets or sets the returned alarm background color. This color applies to the records shown with state ALM_RTN.

**Type**

Integer

**Default**

White

**Syntax**

```
Object.AlmRtnBackColor [= color]
```

**Value**

```
color
```

A value or constant that determines the color of the background.

---

**AlmRtnForeColor Property**

Gets or sets the returned alarm foreground color. This color applies to the records shown with state ALM_RTN.

**Type**

Integer

**Default**

Blue

**Syntax**

```
Object.AlmRtnForeColor [= color]
```

**Value**

```
color
```

A value or constant that determines the color of the text.

---

**Authentication Property**

Returns the Authentication Type selected in the Database tab.
Type
Message
Syntax
AType = AlarmDBCtrl1.Authentication;
Value
AType
A message value; either 'SQL Authentication' or 'Windows Authentication'.

AuthenticationMode Property
Sets the Authentication Mode.
Type
Integer
Syntax
Object.AuthenticationMode = [Int]
Value
Int
A integer value of 0 or 1. 0 denotes SQL Authentication and 1 denotes Windows Authentication.

AutoConnect Property
Gets or sets a value that determines whether the control automatically connects to the database at run time.
Data Type
Integer
Default
False
Syntax
Object.AutoConnect [= Integer]
Value
Integer
An integer expression specifying whether the control connects to the database at run time.
True = Connects to the database.
False = (Default) Does not connect to the database.
Remarks
You must explicitly call the Connect() method to connect to the database.

ColorPriorityRange1 Property
Sets the boundary of the priority range in which alarms are to be shown. The value of this property must be greater than one and less than the value for ColorPriorityRange2.
Type
Integer
Default
250

Syntax

```
Object.ColorPriorityRange1 [= integer or priority]
```

**ColorPriorityRange2 Property**

Sets the boundary of the priority range in which alarms are to be shown. The value of this property must be greater than the value for ColorPriorityRange1 and less than the value for ColorPriorityRange3.

**Type**

Integer

**Default**

500

**Syntax**

```
Object.ColorPriorityRange2 [= integer or priority]
```

**ColorPriorityRange3 Property**

Sets the boundary of the priority range in which alarms are to be shown. The value of this property must be greater than the value of ColorPriorityRange2 and less than 999.

**Type**

Integer

**Default**

750

**Syntax**

```
Object.ColorPriorityRange3 [= integer or priority]
```

**ColumnResize Property**

Returns or sets a value that determines whether the columns can be resized.

**Type**

Discrete

**Default**

True

**Syntax**

```
Object.ColumnResize [= Discrete]
```

**Value**

- *Discrete*
  - True = (Default) Columns can be resized at runtime.
  - False = Columns cannot be resized.

**ConnectStatus Property**

Returns the status of the connection. This property is read-only.
### Data Type

**Message**

**Syntax**

```plaintext
Object.ConnectStatus
```

**Values**
- **Connected** = The control is connected to the database.
- **Not Connected** = The control is not connected to the database.
- **In Progress** = The control is connecting to the database.

**Example**

The name of the control is AlmDbView1 and tagname is a message tag.

```plaintext
Tagname = #AlmDbView1.ConnectStatus;
```

### CustomMessage Property

Gets or sets the message that the Alarm DB View control shows when no alarm records can be retrieved from the alarm database.

**Type**

Message

**Default**

There are no items to show in this view.

**Syntax**

```plaintext
Object.CustomMessage [= string]
```

### DatabaseName Property

Specifies the database to connect to.

**Type**

Message

**Syntax**

```plaintext
Object.DatabaseName [= text]
```

### DisplayMode Property

Returns the display mode of the control, which determines if just alarms, just events, or both alarms and events are shown. This property is read-only.

**Type**

String

**Default**

Alarms & Events History

**Syntax**

```plaintext
Object.DisplayMode
```

**Remarks**

Possible values are:
- Alarms & Events History
- Alarms History
Events History

Example

The name of the control is AlmDbView1 and tag is a message tag.
tag = #AlmDbView1.DisplayMode;

DisplayedTimeZone Property

Gets or sets the shown time zone.

Type
String

Default
Local Time

Syntax
Object.DisplayedTimeZone [= message]

Remarks
Possible values are:

- GMT - Alarm time stamps use Greenwich Mean Time.
- Local Time - Alarm time stamps are shown with the local time of the client hosting the Alarm DB View control.
- Origin Time - Alarm time stamps are shown with the local time of the alarm provider.

Duration Property

Gets or sets the duration used to set the start and end time.

Type
Message

Default
"Last Hour"

Syntax
Object.Duration [= text]
Viewing Recorded Alarms

**Value**

```
text
```
A string expression that contains the duration. This property must have one of the following strings:
- Last Minute
- Last 5 Minutes
- Last 15 Minutes
- Last Half Hour
- Last Hour
- Last 2 Hours
- Last 4 Hours
- Last 8 Hours
- Last 12 Hours
- Last Day
- Last 2 Days
- Last 3 Days
- Last Week
- Last 2 Weeks
- Last 30 days
- Last 90 days

**EndTime Property**

Returns or sets the end time.

**Type**

Message

**Syntax**

```
Object.EndTime [= text]
```

**Value**

```
text
```
A string expression that evaluates to the end time. The string returned is always in the format (MM/DD/YYYY HH:MM:SS). The same format is also required to set the value of the string. This property handles date in any time zone from midnight, January 1, 1970, to January 18, 19:14:07, 2038.

**EventBackColor Property**

Gets or sets the event alarm background color. This color applies to the records shown in the control with state EVT_EVT.

**Type**

Integer

**Default**

White

**Syntax**

```
Object.EventBackColor [= color]
```

**Value**

```
color
```
A value or constant that determines the color of the background.
**EventForeColor Property**

Gets or sets the event alarm foreground color. This color applies to the records shown in the control with state EVT_EVT.

**Type**
Integer

**Default**
Red

**Syntax**

\[ Object.EventForeColor \[= \text{color}\] \]

**Value**

\[ \text{color} \]
A value or constant that determines the color of the text.

**FilterFavoritesFile Property**

Gets or sets the filter favorites file. This file is used by the Filter Favorites dialog box to read or write filter favorites.

**Type**
String

**Default**
Null

**Syntax**

\[ Object.FilterFavoritesFile \[= \text{String}\] \]

**FilterMenu Property**

Gets or sets a value that determines whether the Filter menu item is shown in the shortcut menu.

**Type**
Discrete

**Default**
True

**Syntax**

\[ Object.FilterMenu \[= \text{Discrete}\] \]

**Value**

True = Filter menu item is shown (default).
False = Filter menu item is not shown.

**FilterName Property**

Returns the name of the current filter (if any).

**Type**
String (read-only)
Default

Null

Syntax

Object.FilterName [= String]

FromPriority Property

Gets or sets the From Priority value of the control.

Type

Integer

Default

1

Syntax

Object.FromPriority [= integer]

Remarks

You can use this property to filter which alarm records are shown. For example, if you set this property to 760, then only alarms with priority from 760 to the ToPriority property value are shown.

GroupExactMatch Property

When the GroupExactMatch property is true, only alarms with alarm group names that exactly match the GroupName property value are shown. When it is false, then the group name need only specify part of the alarm group names it is filtering for.

Type

Discrete

Default

False

Syntax

Object.GroupExactMatch [= discrete]

Remarks

Use this property together with the GroupName property to filter the Alarm DB View control.

Example

For example:

#AlarmDBViewCtrl1.GroupName = "Group"
#AlarmDBViewCtrl1.GroupExactMatch = 0;
#AlarmDBViewCtrl1.Refresh();

GroupName Property

Gets or sets a alarm group name filter for the current Alarm DB View control.

Type

String

Default

(none)
Syntax

Object.GroupName [= GroupName]

Remarks

Setting this property to "GroupA" and re-querying the display shows only tags belonging to the GroupA alarm group.

MaxRecords Property

Returns or sets the maximum records to be retrieved.

Type

Integer

Default

100

Syntax

Object.MaxRecords [=integer]

Value

integer
An integer expression specifying the number of records to be retrieved at a given time. The maximum records can be in the range from 1 to 1000. For best performance keep this value as small as needed.

Password Property

Returns or sets the SQL Server password for retrieving data.

Type

Message

Syntax

Object.Password [= text]

Value

text
A string expression that evaluates to the password.

PrimarySort Property

Gets or sets the primary column name used to sort the alarm display.

Type

Message

Default

(none)

Syntax

Object.PrimarySort [= message]
ProviderExactMatch Property

When the ProviderExactMatch property is true, only alarms with alarm provider names that exactly match the ProviderName property value are shown. When it is false, then the provider name need only specify part of the alarm provider names it is filtering for.

**Type**
Discrete

**Default**
False

**Syntax**
```csharp
Object.ProviderExactMatch [= discrete]
```

**Remarks**
Use this property together with the ProviderName property to filter the Alarm DB View control.

**Example**
For example:
```csharp
#AlarmDBViewCtrl1.ProviderName = "Provider"
#AlarmDBViewCtrl1.ProviderExactMatch = 0;
#AlarmDBViewCtrl1.Refresh();
```

ProviderName Property

Gets or sets a alarm provider name filter for the current Alarm DB View control.

**Type**
String

**Default**
(none)

**Syntax**
```csharp
Object.ProviderName [= ProviderName]
```

**Remarks**
If a tag belongs to the Provider1 alarm provider, then setting this property to "Provider1" and re-querying the display shows only tags belonging to the Provider1 alarm provider.

QueryTimeZoneName Property

Gets or sets the time zone when a specific time is used for the query.

**Type**
Discrete

**Default**
False

**Syntax**
```csharp
Object.QueryTimeZoneName [= Discrete]
```

**Value**
True = GMT
False = Origin time, which is the local time of the alarm provider.

**RefreshMenu Property**

Gets or sets a value that determines whether the Refresh menu item is shown in the shortcut menu.

**Type**

Discrete

**Default**

True

**Syntax**

`Object.RefreshMenu [= Discrete]`

**Value**

True = Refresh menu item is shown (default).

False = Refresh menu item is not shown.

**ResetMenu Property**

Gets or sets a value that determines whether the Reset menu item is shown in the shortcut menu.

**Type**

Discrete

**Default**

True

**Syntax**

`Object.ResetMenu [= Discrete]`

**Value**

True = Reset menu item is shown (default).

False = Reset menu item is not shown.

**RowCount Property**

Returns the number of records shown in the control. This property is read-only.

**Type**

Integer

**Syntax**

`Object.RowCount`

**Example**

The name of the control is AlmDbView1 and tagname an integer tag.

`tagname = #AlmDbView1.RowCount;`

**RowSelection Property**

Returns or sets a value that determines whether the row selection is allowed at runtime.

**Type**

Discrete
Default
True

Syntax
Object.RowSelection [= Discrete]

Value
Discrete
True = (Default) Row selection is allowed.
False = Row Selection is not allowed.

Remarks
If row selection is not allowed, no Click or DoubleClick events are generated.

SecondarySort Property

Gets or sets the secondary column name used to sort the alarm display.

Type
Message

Default
Default

Syntax
Object.SecondarySort [= text]

ServerName Property

Returns or sets the server name to which the control connects to retrieve data.

Type
Message

Syntax
Object.ServerName [= text]

ShowFetch Property

Returns or sets a value that determines whether the retrieval buttons are shown.

Type
Discrete

Default
True

Syntax
Object.ShowFetch [= Discrete]

Value
Discrete
True = (Default) Retrieve buttons are shown.
False = Retrieve buttons are not shown.
ShowGrid Property
Returns or sets a value that determines whether the grid lines are shown.

**Type**
Discrete

**Default**
False

**Syntax**
```
Object.ShowGrid [= Discrete]
```

**Value**

Discrete
- True = Grid lines are shown.
- False = (Default) Grid lines are not shown.

ShowHeading Property
Returns or sets a value that determines whether the column headings are shown.

**Type**
Discrete

**Default**
True

**Syntax**
```
Object.ShowHeading [= Discrete]
```

**Value**

Discrete
- True = (Default) Column headings are shown.
- False = Column headings are not shown.

ShowMessage Property
Determines if the customized message for “There are no items to show in this view” is shown when there are no records in the alarm database.

**Type**
Discrete

**Default**
False

**Syntax**
```
Object.ShowMessage [= discrete]
```

ShowStatusBar Property
Returns or sets a value that determines whether the status bar is shown.

**Type**
Discrete
**SortMenu Property**

Returns or sets a value that determines whether the **Sort** menu item is shown in the shortcut menu.

**Type**

Discrete

**Default**

True

**Syntax**

`Object.SortMenu [= Discrete]`

**Value**

A discrete expression.

True = (Default) **Sort** menu item is shown
False = **Sort** menu item is not shown.

**SortOrder Property**

Gets or sets the sort order of the alarms according to the column to be sorted (the primary sort column).

**Type**

Discrete

**Default**

True

**Syntax**

Object.SortOrder [= Discrete]
**Syntax**

```csharp
Object.SortOrder [= discrete]
```

**Value**

An discrete expression.

True = Ascending order.

False = Descending order.

**SpecificTime Property**

Returns or sets a value that determines whether the control uses the StartTime and EndTime properties, or computes the start time and end time based on the value of the Duration property.

**Type**

Discrete

**Default**

False

**Syntax**

```csharp
Object.SpecificTime [= Discrete]
```

**Value**

True = StartTime and EndTime properties are used.

False = (Default) StartTime and EndTime are computed based on the "Duration" property.

**StartTime Property**

Returns or sets the start time.

**Type**

Message

**Syntax**

```csharp
Object.StartTime [= text]
```

**Value**

```text
A string expression that evaluates to the Start Time. The string returned is always in the format (MM/DD/YYYY HH:MM:SS). The same format is also required to set the value of the string. This property handles date in any time zone from midnight, January 1, 1970, to January 18, 19:14:07, 2038
```

**Time Property**

Gets and sets the time format to be used in the display.

**Type**

Message

**Default**

```text
%m/%d/%Y %I:%M:%S %p
```

**Syntax**

```csharp
Object.Time [= message]
```
Remarks
For more information on the time format strings, see Configuring the Shown Time Format and Time Zone for Alarm Records on page 214.

**ToPriority Property**

Gets or sets the To Priority value of the control.

**Type**
Integer

**Default**
999

**Syntax**
Object.ToPriority [= integer]

**Remarks**
Use this property to filter which alarm records are shown. For example, if you set this property to 900, then only alarms with priority from the FromPriority property value to 900 are shown.

**TotalRowCount Property**

Returns the total number of records for the current query. This property is read-only.

**Type**
Integer

**Syntax**
Object.TotalRowCount

**Remarks**
The row count is the number of rows returned in the current query, which usually would be same as MaxRecords property except for the case when number of records retrieved are less than the MaxRecords property. For example, if there are 950 records for a specific criterion and the MaxRecords property is 100, then in the last page there would be 50 records and the row count would be 50. In the same example, the TotalRowCount property would always be 950.

**Example**
The name of the control is AlmDbView1 and tagname is an integer tag.
tagname = #AlmDbView1.TotalRowCount;

**UnAckAlmBackColor Property**

Gets or sets the unacknowledged alarm background color. This color applies to all records shown in the control with state UNACK_ALM. It overrides any settings made by the UnAckAlmBackColorRange1 to UnAckAlmBackColorRange4 property values.

**Type**
Integer

**Default**
White

**Syntax**
Object.UnAckAlmBackColor [= color]
Value

\texttt{color}

A value or constant that determines the color of the specified object.

\textbf{UnAckAlmBackColorRange1 Property}

Gets or sets the unacknowledged alarm background color. This color applies to the records shown in the control with state UNACK\_ALM with priorities in the range 1 to ColorPriorityRange1.

\textbf{Type}

Integer

\textbf{Default}

White

\textbf{Syntax}

\texttt{Object.UnAckAlmBackColorRange1 \[= color\]}

\textbf{Value}

\texttt{color}

A value or constant that determines the color of the specified object.

\textbf{UnAckAlmBackColorRange2 Property}

Gets or sets the unacknowledged alarm background color. This color applies to the records shown in the control with state UNACK\_ALM with priorities in the range ColorPriorityRange1 to ColorPriorityRange2.

\textbf{Type}

Integer

\textbf{Default}

White

\textbf{Syntax}

\texttt{Object.UnAckAlmBackColorRange2 \[= color\]}

\textbf{Value}

\texttt{color}

A value or constant that determines the color of the specified object.

\textbf{UnAckAlmBackColorRange3 Property}

Gets or sets the unacknowledged alarm background color. This color applies to the records shown in the control with state UNACK\_ALM with priorities in the range ColorPriorityRange2 to ColorPriorityRange3.

\textbf{Type}

Integer

\textbf{Default}

White

\textbf{Syntax}

\texttt{Object.UnAckAlmBackColorRange3 \[= color\]}
**Value**

*color*

A value or constant that determines the color of the specified object.

**UnAckAlmBackColorRange4 Property**

Gets or sets the unacknowledged alarm background color. This color applies to the records shown in the control with state UNACK_ALM with priorities in the range ColorPriorityRange3 to 999.

**Type**

Integer

**Default**

White

**Syntax**

`Object.UnAckAlmBackColorRange4 [= color]`

**Value**

*color*

A value or constant that determines the color of the specified object.

**UnAckAlmForeColor Property**

Gets or sets the unacknowledged alarm text color. This color applies to all records shown in the control with state UNACK_ALM. It overrides any settings made by the UnAckAlmForeColorRange1 to UnAckAlmForeColorRange4 property values.

**Type**

Integer

**Default**

Red

**Syntax**

`Object.UnAckAlmBackColor [= color]`

**Value**

*color*

A value or constant that determines the color of the text.

**UnAckAlmForeColorRange1 Property**

Gets or sets the unacknowledged alarm foreground color. This color applies to the records shown in the control with state UNACK_ALM with priorities in the range 1 to ColorPriorityRange1.

**Type**

Integer

**Default**

Red

**Syntax**

`Object.UnAckAlmForeColorRange1 [= color]`
Value

*color*
A value or constant that determines the color of the specified object.

**UnAckAlmForeColorRange2 Property**

Gets or sets the unacknowledged alarm foreground color. This color applies to the records shown in the control with state UNACK_ALM with priorities in the range ColorPriorityRange1 to ColorPriorityRange2.

**Type**
Integer

**Default**
Red

**Syntax**

```
Object.UnAckAlmForeColorRange2 [= color]
```

**Value**

*color*
A value or constant that determines the color of the specified object.

**UnAckAlmForeColorRange3 Property**

Gets or sets the unacknowledged alarm foreground color. This color applies to the records shown in the control with state UNACK_ALM with priorities in the range ColorPriorityRange2 to ColorPriorityRange3.

**Type**
Integer

**Default**
Red

**Syntax**

```
Object.UnAckAlmForeColorRange3 [= color]
```

**Value**

*color*
A value or constant that determines the color of the specified object.

**UnAckAlmForeColorRange4 Property**

Gets or sets the unacknowledged alarm foreground color. This color applies to the records shown in the control with state UNACK_ALM with priorities in the range ColorPriorityRange3 to 999.

**Type**
Integer

**Default**
Red

**Syntax**

```
Object.UnAckAlmForeColorRange4 [= color]
```
**Value**

*color*

A value or constant that determines the color of the specified object.

**UnAckOrAlarmDuration Property**

The duration column shows either UNACK Duration or Alarm Duration. FALSE (0) is UNACK Duration and TRUE (1) is Alarm Duration.

*Type*

Integer

*Default*

False

*Syntax*

```
Object.UnAckOrAlarmDuration [= integer]
```  

**UserID Property**

Returns or sets the user ID used as the control to connect to the SQL Server to retrieve the data.

*Type*

Message

*Syntax*

```
Object.UserID [= text]
```  

**Value**

*text*

A string expression that evaluates the user ID.

**Using Alarm DB View ActiveX Methods**

Use the Alarm DB View ActiveX methods to:

- Control the database connection.
- Retrieve records from the alarm database.
- Retrieve information about an alarm.
- Reset the display appearance.
- Sort alarm records.
- Show the **Context** menu.
- Access filter favorites.

For more information about calling methods, see Scripting ActiveX Controls in the InTouch® HMI Scripting and Logic Guide.

**Controlling Alarm Database Connections**

Use the Connect() method to connect to the alarm database and the Disconnect() method to disconnect.
Connect()

Connects the control to the database and if the connection is successful, shows the set of records in the range 1 to MaxRecords.

**Syntax**

```
Object.Connect
```

**Example**

The name of the control is AlmDbView1.

```
#AlmDbView1.Connect();
```

Disconnect()

Disconnects the control from the database.

**Syntax**

```
Object.Disconnect
```

**Example**

The name of the control is AlmDbView1.

```
#AlmDbView1.Disconnect();
```

Retrieving Alarm Records from the Database

Use the following methods to select a query, retrieve records from the database, and refresh the display:

- `SelectQuery()` on page 248
- `GetPrevious()` on page 248
- `GetNext()` on page 249
- `Refresh()` on page 249

SelectQuery()

Sets the current display to the query name specified in the .xml file.

**Syntax**

```
Object.SelectQuery(“QueryName”);
```

**Parameters**

- `QueryName`
  Name of a query defined in the filter favorites file.

**Example**

This example applies the filter criteria defined by the query called "HighPriority" in the filter favorites file that is currently associated with the AlmDbView1 control.

```
#AlmDbView1.SelectQuery("HighPriority");
```

GetPrevious()

Retrieves the previous set of records from the database (if any).

**Syntax**

```
Object.GetPrevious();
```
### Example

The name of the control is AlmDbView1.

```csharp
#AlmDbView1.GetPrevious();
```

### GetNext()

Retrieves the next set of records from the database (if any).

**Syntax**

```csharp
Object.GetNext
```

**Example**

The name of the control is AlmDbView1.

```csharp
#AlmDbView1.GetNext();
```

### Refresh()

Refreshes the control from the database, and if the connection is successful, displays the set of records in the range 1 to MaxRecords.

**Syntax**

```csharp
Object.Refresh
```

**Remarks**

After initiating a refresh of the Alarm DB View control's display by calling its Refresh() method, the value of the RowCount and TotalRowCount properties change to -1 until the refresh is complete (that is, all relevant records are retrieved from the database). When the refresh is complete, both properties are updated with the correct, current row count.

The Refresh() method works asynchronously - it returns control to the calling script immediately and continues working in the background. This means that querying the value of RowCount and TotalRowCount immediately after calling Refresh() most likely returns -1, as their value is queried at a time when the refresh still hasn't completed. One way to get the correct values would be to use scripting to determine when the value of either property changes from -1 to a different value; this tells you that the correct values are now available.

**Example**

The name of the control is AlmDbView1.

```csharp
#AlmDbView1.Refresh();
```

### Retrieving Information About an Alarm

Use the following methods to retrieve records from the database about a particular alarm:

- **GetItem() Method** on page 73
- **GetSelectedItem() Method** on page 250

### GetItem() Method

Returns the data at a specified row & column as string.

**Syntax**

```csharp
Object.GetItem(Integer, message)
```

**Parameters**

- `Integer`: An integer expression that evaluates to a specific row in the control.
Viewing Recorded Alarms

InTouch HMI Alarms and Events Guide

Message
A string expression that evaluates to the column name in the control.

Example
The name of the control is AlmDbView1 and tag is defined as a Message tag.

```
tag = #AlmDbView1.GetItem(1, "Group");
```

GetSelectedltem() Method

Returns the data for the selected row, given column as string

Syntax

```
Object.GetSelectedltem(message)
```

Parameters

- **Message**
  A string expression that evaluates to the column name in the control

Example
The name of the control is AlmDbView1 and tag is defined as Message tag.

```
tag = #AlmDbView1.GetSelectedltem("State");
```

Sorting the Alarm Records

Use the following methods to sort alarm records and reset column resizing:

- **SortOnCol() Method** on page 250
- **ShowSort() Method** on page 76
- **Reset() Method** on page 251

SortOnCol() Method

Performs primary sorting on alarm records that are shown.

Syntax

```
Object.SortOnCol(message, Integer)
```

Parameters

- **Message**
  A string expression that evaluates to the column name in the control
- **Integer**
  Sort direction to be used. 0 = ascending, 1 = descending.

Example
The name of the control is AlmDbView1.

```
tag = #AlmDbView1.SortOnCol("Name",1);
```

ShowSort() Method

 Shows the Secondary Sort dialog box if the SortMenu property is enabled.

Syntax

```
Object.ShowSort
```

Example
The name of the control is AlmDbView1.
Reset() Method

Resets all the columns to the settings saved at design time.

**Syntax**

```
Object.Reset
```

**Example**

The name of the control is AlmDbView1.

```
#AlmDbView1.Reset();
```

Showing the Context Menu

Use the ShowContext() method to show the shortcut menu.

**ShowContext() Method**

Shows the shortcut menu if any one of RefreshMenu or ResetMenu or SortMenu property is enabled.

**Syntax**

```
Object.ShowContext
```

**Example**

The name of the control is AlmDbView1.

```
#AlmDbView1.ShowContext();
```

Accessing Filter Favorites

Use the ShowFilter() method to show the Filter Favorites dialog box.

**ShowFilter() Method**

Shows the Filter Favorites dialog box.

**Syntax**

```
Object.ShowFilter
```

**Example**

The name of the control is AlmDbView1.

```
#AlmDbView1.ShowFilter();
```

Showing Other Information

Use the AboutBox() method to show the About dialog box.

**AboutBox() Method**

Shows the About dialog box.

**Syntax**

```
Object.AboutBox()
```

**Example**

The name of the control is AlarmPareto1.

```
#AlarmPareto1.AboutBox();
```
Handling Errors With Using Methods and Properties

Use the SilentMode property to determine whether the control is in silent mode or not. When the control is in silent mode, no error messages are shown. To see the error, call the GetLastError() method to return the error message.

GetLastError() Method

Returns the last error message if the Alarm DB View control is in silent mode.

Syntax

\[ \text{Object}.\text{GetLastError}() \]

Example

The name of the control is AlmDbView1 and tagname is defined as variant or string.

\[ \text{Tagname} = #\text{AlmDbView1.GetLastError}(); \]

Using Alarm DB View ActiveX Events to Trigger Scripts

You can assign QuickScripts to Alarm DB View control events, such as a mouse click or double-click. When the event occurs, the QuickScript runs.

The Alarm DB View control supports the following events:

- Click
- DoubleClick
- ShutDown
- StartUp

The Click event has one parameter called ClicknRow, which identifies the row that is clicked at run time.

The DoubleClick event has one parameter called DoubleClicknRow, which identifies the row that is double-clicked at run time.

Click and DoubleClick events are zero-based. When Click and/or DoubleClick events are published, the bar count in the display starts with 0.

Note: The Alarm DB View control ignores the user interface methods when they are called from StartUp event, because the control is not visible yet. These methods include: ShowSort(), ShowContext(), GetSelectedItem(), GetNext(), GetPrevious(), and AboutBox().

For more information about scripting ActiveX events, see Scripting ActiveX Controls in the InTouch® HMI Scripting and Logic Guide.
About Analyzing Alarm Distribution Across Tags

Using the Alarm Pareto ActiveX control, you can analyze which alarms and events occur most frequently in a given production system. You can also analyze alarm frequency by the time periods during which they occur.

The analysis capabilities of the Alarm Pareto control identify the largest issues of your production systems. The Alarm Pareto control helps you recognize where you should focus your efforts to achieve the most significant improvements.

The Alarm Pareto control shows a bar chart representing alarm activity.

For more information about ActiveX controls, see ActiveX Controls in the InTouch® HMI Visualization Guide.

Configuring an Alarm Pareto ActiveX Control

When you configure an Alarm Pareto control, you specify:

- The connection to the alarm database.
- The appearance of the pareto control, including colors and fonts.
- Which features users can access at run time.
- Which alarms are shown in the chart and how they are presented.

Configuring the Connection to the Alarm Database

You must configure the connection between the Alarm Pareto control and the alarm database.

It is good practice to use an account with appropriate read-only access to the alarm database and not a system administrator account.

To configure the connection to the alarm database

1. Right-click the Alarm Pareto control and then click Properties. The AlarmPareto Properties dialog box appears.
2. Click the **Database** tab.

3. Configure the connection. Do the following:
   
   a. In the **Authentication** list, select the authentication method: SQL Server Authentication or Windows Authentication (default).
   
   **Note:** When you switch from Windows Authentication to SQL Authentication, a pop up dialog will appear with a recommendation to use Windows Authentication for better application security. To proceed with SQL Authentication, click **OK**. A similar message is also logged in the SMC Log Viewer.
   
   b. In the **Server Name** box, enter the node name of the computer where the alarm database is installed.
   
   c. In the **Database Name** box, type the name of the alarm database.
   
   d. In the **User** box, type the name of a valid user account for the alarm database.
   
   e. In the **Password** box, type the password associated with the alarm database user account.
   
   **Note:** The Windows Authentication method uses the credentials of the user currently logged in, and disables the user name and password fields.
   
4. Select the **Auto Connect** check box if you want the Alarm Pareto control to automatically connect to the alarm database as soon as WindowViewer starts up.

   If you don’t select the **Auto Connect** check box, you must configure the Alarm Pareto control to connect to the alarm database by explicitly calling the Connect() method. For more information about the Connect method, see **Connect() Method** on page 266.

5. Click **Test Connection** to verify connectivity to the alarm database. A message indicates a successful connection.

6. Click **Apply**.
Configuring the Appearance and Colors of the Alarm Pareto Control

You can configure the visual appearance of the Alarm Pareto control. You can:

- Include a status bar.
- Set the orientation of the Pareto chart bars.
- Include descriptions of chart bars.
- Select the colors of the Alarm Pareto chart.

To set the appearance of the Alarm Pareto control

1. Right-click the Alarm Pareto control and then click Properties. The AlarmPareto Properties dialog box appears.
2. Click the General tab.

![Alarm Pareto Properties dialog box]

3. Configure the general options. Do the following:

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Bar Count</strong></td>
<td>Sets the number of bars to view in the Alarm Pareto control.</td>
</tr>
<tr>
<td><strong>Display Mode</strong></td>
<td>This list shows the available view options. The options are Alarm &amp; Event History, Alarm History, and Event History.</td>
</tr>
<tr>
<td><strong>No-Match Message</strong></td>
<td>Sets the message to show when no data is processed from the Alarm Pareto control.</td>
</tr>
<tr>
<td><strong>Vertical</strong></td>
<td>Shows the bars on a vertical scale.</td>
</tr>
<tr>
<td><strong>Horizontal</strong></td>
<td>Shows the bars on a horizontal scale.</td>
</tr>
<tr>
<td><strong>Show Status Bar</strong></td>
<td>Enables the status bar.</td>
</tr>
<tr>
<td><strong>Silent Mode</strong></td>
<td>The Alarm Pareto control does not show run-time error messages. If it is not selected, the alarm display shows error messages. Error messages are always sent to the Logger.</td>
</tr>
<tr>
<td><strong>Auto Font</strong></td>
<td>When the space available is not enough to show the text on the selected bar correctly, Auto Font hides the text and only shows the text when the bar is selected.</td>
</tr>
</tbody>
</table>
Analyzing Alarm Distribution Across Tags

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Show Node Name</td>
<td>Shows the node name on the bar graph.</td>
</tr>
<tr>
<td>Show Selected in Status Bar</td>
<td>Shows the description of a selected bar on the status bar.</td>
</tr>
<tr>
<td>Consolidated Alarms</td>
<td>Consolidate the alarm states into two states. For example, if an analog tag has a three-state alarm: Hi, HiHi and Normal, the Hi and HiHi alarm states are classified as one state.</td>
</tr>
<tr>
<td>Show Count in Percentages</td>
<td>Shows the bars based on the percentage of count to the total count.</td>
</tr>
<tr>
<td>Show Time in State</td>
<td>Shows the Alarm Pareto control based on the time each tag is in an alarm state. This option is only enabled when the display mode is set to Alarm History.</td>
</tr>
</tbody>
</table>

4. Click **Apply**.
5. Click the **Colors** tab.

![Alarm Pareto Properties](image)

6. Click each color box to open a color palette.
7. Click the color that you want to assign for each of the following chart properties:

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Background Color</td>
<td>Sets the background color of the Alarm Pareto chart</td>
</tr>
</tbody>
</table>
Analyzing Alarm Distribution Across Tags

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Bar Color</td>
<td>Sets the bar color of the chart</td>
</tr>
<tr>
<td>Font Color</td>
<td>Sets the color of text that appears in the chart</td>
</tr>
<tr>
<td>Select Color</td>
<td>Sets the color of a selected bar</td>
</tr>
</tbody>
</table>

8. Click **Apply**.

**Configuring the Display of the Font**

You can assign font properties to text that appears in your Alarm Pareto chart.

**To configure the font properties**

1. Right-click the Alarm Pareto control and then click **Properties**. The **AlarmPareto Properties** dialog box appears.
2. Click the **General** tab.

![AlarmPareto Properties dialog box](image)

3. Click Font. The standard Windows **Font** dialog box appears. Configure the font and then click **OK**.
4. Click **OK**.

**Configuring Which Features Users can Access at Run Time**

An Alarm Pareto chart includes a shortcut menu. When an operator right-clicks on the trend during run time, a menu appears with options to dynamically update the data shown in the trend.

![Shortcut menu](image)

**To configure run time features**

1. Right-click the Alarm Pareto control and then click **Properties**. The **AlarmPareto Properties** dialog box appears.
2. Click the General tab.

3. In the Context Sensitive Menu Options area, configure the menu commands:
   a. Select the Enable Refresh Menu check box to allow the run time user to refresh the data shown in the Alarm Pareto trend and show the records in the range from 1 to the number defined by the MaxRecords property.
   b. Select the Enable Filter Menu check box to allow the user to show the Filter Favorites dialog box to select a file containing database query values for the Alarm Pareto trend.
   c. Select the Enable Reset Menu check box to allow the user to restore the run-time Alarm Pareto chart to the original values specified from WindowMaker. All run-time changes made by an operator revert to the original design-time values.

4. Click Apply.

Configuring Which Alarms to Analyze

You configure which alarms to analyze using the Alarm Pareto chart. You specify:

- The type of database data (alarm or event data)
- A time period to select records from
- Criteria for filtering the data

Selecting Alarm or Event Data

You can configure if alarm records, event records, or both appear in an Alarm Pareto chart.

To select the type of data

1. Right-click the Alarm Pareto control and then click Properties. The AlarmPareto Properties dialog box appears.
2. Click the General tab.

3. In the **Display Mode** list, configure the type of records. Do any of the following.
   - Click **Alarm & Event History** to show both alarm and event historical database records.
   - Click **Alarm History** to show only historical alarm records.
   - Click **Event History** to show only historical event records.

4. Click **Apply**.

**Selecting the Time Period**

You can set query values to select records based on the selected time. You can also configure the maximum number of records to view, the start and end time of the alarm query, and the query time zone.

**To select the time period of data**

1. Right-click the Alarm Pareto control and then click Properties. The AlarmPareto Properties dialog box appears.
2. Click the **Selection** tab.

3. To use a pre-defined time interval that always queries for data using UTC, click an interval from the **Duration** list.
4. To use a specific start time and end time, click **Use Specific Time** and then configure the details.
   a. In the **Start Time** box, enter the start time to retrieve the alarm records. The string must be in MM/DD/YYYY HH:MM:SS format. Use any date in any time zone from midnight, January 1, 1970, to January 18, 19:14:07, 2038.
b. In the **End Time** box, enter the end time to stop retrieving alarm records. The string must be in MM/DD/YYYY HH:MM:SS format. Use any date in any time zone from midnight, January 1, 1970, to January 18, 19:14:07, 2038.

c. In the **Query Time Zone** area, click either **UTC** or **Origin Time**. UTC time is Greenwich Mean Time, also known as Coordinated Universal Time or Zulu. Origin time is the current time in the operator’s time zone.

5. In the **Maximum Records** box, type the number of records to view from the control at one instance. The valid range of maximum records is from 0 to 100000.

6. Click **Apply**.

### Creating Custom Filters Using Filter Favorites

You can select which records are included in your query results. For example, you can select a filter by the date of a record or the state of the alarm. You can select multiple fields to limit or expand your query results.

If you do not define a custom filter, then a default filter that queries all records is used.

**To create custom filters**

1. Right-click the Alarm Pareto control and then click Properties. The AlarmPareto Properties dialog box appears.

2. Click the **Query Filter** tab.

3. In the left pane, select filter fields and then click **Add** to include them in the filter, which is shown in the right pane. The filter fields are described in the following table:

<table>
<thead>
<tr>
<th>Field name</th>
<th>Filters query by:</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Class</strong></td>
<td>Alarm class.</td>
</tr>
<tr>
<td><strong>Type</strong></td>
<td>Alarm type.</td>
</tr>
<tr>
<td><strong>Priority</strong></td>
<td>Alarm priority.</td>
</tr>
<tr>
<td><strong>Name</strong></td>
<td>Alarm name.</td>
</tr>
<tr>
<td><strong>GroupName</strong></td>
<td>Alarm group name.</td>
</tr>
<tr>
<td><strong>Provider</strong></td>
<td>Alarm provider.</td>
</tr>
</tbody>
</table>
4. To remove a field from the filters pane, click the field you want to delete and click Delete. Deleting a filter cannot be undone. When a message appears, click Yes.

5. Configure the criteria for each filter field. For more information, see Defining the Column Filter Criteria on page 219.

6. Configure the operators and grouping for the filter. For more information, see Grouping Alarm Columns on page 220.

7. Configure the filter favorites file.
   a. In the Filter Favorites File box, type the network path and file name or click the ellipse button to browse for the file.
   b. To edit the Filter Favorites file, click the Edit Favorites File button. The Filter Favorites window opens, allowing you to add, modify, or delete filters from your favorites file. When you are done, click OK to save your changes and close the window.

8. Click Apply.

Defining the Column Filter Criteria

For each column filter you include in the query, you must configure the filter criteria. For example, you might want to only see alarms for a specific operator.
To define a column filter

1. Right-click the field and then click Edit Filter. The Dialog dialog box appears.

![Dialog dialog box](image)

2. In the Operator list, select the operator you need.
3. In the Value box, type the criteria that must be matched. The Value box does not accept values that cannot be processed for the selected query. The Value box accepts the following wildcard characters when the Like and Not Like filter operators are used for alphanumeric column names:

<table>
<thead>
<tr>
<th>Character</th>
<th>Finds</th>
</tr>
</thead>
<tbody>
<tr>
<td>%</td>
<td>Any string of zero or more characters</td>
</tr>
<tr>
<td>_</td>
<td>Any single character</td>
</tr>
<tr>
<td>[ ]</td>
<td>Any single character within the specified range, for example [a-f], or within a set, for example [abcdef].</td>
</tr>
<tr>
<td>[^]</td>
<td>Any single character not within the specified range, for example [^a-f], or set, for example [^abcdef].</td>
</tr>
</tbody>
</table>

The following Value box limits apply to different fields:

<table>
<thead>
<tr>
<th>Field</th>
<th>Limit</th>
</tr>
</thead>
<tbody>
<tr>
<td>All fields</td>
<td>All alphanumeric characters except User1, User2 and Priority.</td>
</tr>
<tr>
<td>Priority</td>
<td>Accepts integer values from 1 to 999.</td>
</tr>
<tr>
<td>User1, User2</td>
<td>Accepts only negative, positive or fractional numbers.</td>
</tr>
</tbody>
</table>

4. Click OK.

Grouping Alarm Columns

When more than one field is defined, the columns are combined using Boolean operators.

- The AND operator returns records that meet all values of the selected fields.
- The OR operator returns records that meet the values of any of the selected fields.

To use AND/OR operators to set the filter selection criteria, the respective fields must be grouped together. Only a single filter expression can be created on an item in the filters pane. If multiple expressions are needed, then the item must be added to the filters pane again.
By default, the grouped fields have the AND operator.
The AND and OR operators are parent nodes. The fields selected under each parent node are child nodes. You cannot drag fields parent nodes to child nodes.

To group alarm columns
1. Right-click the field and then click Group.
2. Drag a field onto another field.

Copying or Moving Query Filters
If you have more than one instance of Alarm Pareto control and want to use the same filters for multiple instances, you can copy or cut the defined filters from one instance and paste them to another filter.

To copy filters
1. Define the filters in the first instance of the Alarm Pareto control.
2. Right-click the filters and click Copy. To move the filters, click Cut.
3. Close the first instance of the Alarm Pareto control.
4. Open the next instance of the Alarm Pareto control and click the Query Filter tab.
5. Position the arrow in the right pane. Right-click on a selected filter and click Paste.

Configuring the Presentation of the Analysis Results
You can configure the presentation of the alarms in the query results.

To configure the presentation
1. Right-click the Alarm Pareto control and then click Properties. The AlarmPareto Properties dialog box appears.
2. Click the General tab.
3. Select the Consolidated Alarms check box to combine alarms from a multi-state alarm into a single time stamped record.
4. Select the Show Count in Percentages check box to add a percentage of the total for each bar shown in the graph.
5. Click Apply.
Using an Alarm Pareto Control at Run Time

Right-click on the Alarm Pareto control during run time to open a shortcut menu. The following table lists all possible options that appear in the shortcut menu.

<table>
<thead>
<tr>
<th>Menu Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Refresh</td>
<td>Refreshes the display.</td>
</tr>
<tr>
<td>Filter</td>
<td>Allows you to edit the filter to change the data received by the Pareto control. This menu item is only available if a filter favorites file is set up.</td>
</tr>
<tr>
<td>Reset</td>
<td>Resets the graph to the default query.</td>
</tr>
</tbody>
</table>

Understanding Information Shown on the Status Bar

The status bar for the Alarm Pareto control shows:

- The status of the database connection between the control and the alarm database.
- The update status of the graph to refresh the data shown in the graph.

Using Alarm Pareto ActiveX Properties

You can set the value an Alarm Pareto control property directly using a script or you can assign it to an InTouch tag or I/O reference. For more information about setting properties, see Scripting ActiveX Controls in the InTouch® HMI Scripting and Logic Guide.

The following table list the Alarm Pareto properties. For information on setting color values, see Configuring Colors for ActiveX Controls on page 65.

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Authentication</td>
<td>Returns the Authentication Type selected in the Database tab.</td>
</tr>
<tr>
<td>AuthenticationMode</td>
<td>Sets a value that determines the Authentication Type (0 for SQL Authentication, 1 for Windows Authentication)</td>
</tr>
<tr>
<td>AutoConnect</td>
<td>Returns or sets a value that determines whether the control connects to the database as soon as the control is in run-time mode.</td>
</tr>
<tr>
<td>AutoFont</td>
<td>When the space available is not enough to show the text on the selected bar correctly, Auto Font hides the text and only shows the text on the selected bar when the bar is selected.</td>
</tr>
<tr>
<td>BackGndColor</td>
<td>Sets the background color of the Alarm Pareto chart</td>
</tr>
<tr>
<td>BarColor</td>
<td>Sets the bar color of the Alarm Pareto control.</td>
</tr>
<tr>
<td>Property Name</td>
<td>Purpose</td>
</tr>
<tr>
<td>--------------------------</td>
<td>----------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>BarCount</td>
<td>Sets the number of bars that appear on the Alarm Pareto control.</td>
</tr>
<tr>
<td>BarSelectColor</td>
<td>Sets the color of the selected bar in the Alarm Pareto Control.</td>
</tr>
<tr>
<td>Connected</td>
<td>Determines if the Alarm Pareto control is connected to a database.</td>
</tr>
<tr>
<td>ConsolidatedAlarms</td>
<td>Consolidates the alarm states into two states. For example, if an analog tag has a three state alarm: Hi, HiHi and Normal, the Hi and HiHi alarm states are classified as one state.</td>
</tr>
<tr>
<td>DatabaseName</td>
<td>Sets the database name to which the Alarm Pareto control has to connect.</td>
</tr>
<tr>
<td>DisplayMode</td>
<td>Sets the display mode. The display mode options are Alarm &amp; Event History, Alarm History or Event History.</td>
</tr>
<tr>
<td>Duration</td>
<td>Returns or sets the duration used by the control to set the “Start Time” and “End Time”.</td>
</tr>
<tr>
<td>EnableRefresh</td>
<td>Enables or disables the context menu to refresh the Alarm Pareto control.</td>
</tr>
<tr>
<td>EnableReset</td>
<td>Enables or disables the context menu used to reset the Alarm Pareo control.</td>
</tr>
<tr>
<td>EnableSilentMode</td>
<td>Enables or disables the Silent Mode. If Silent Mode is disabled, the Alarm Pareto control shows error message boxes. If Silent Mode is enabled, the error message boxes do not appear. Error information is written to the logger.</td>
</tr>
<tr>
<td>EndTime</td>
<td>Returns or sets the end date and time.</td>
</tr>
<tr>
<td>FilterMenu</td>
<td>Enables or disables the context menu where you can edit the filter to change the data received by the Pareto control. This property is only enabled if Filter Menu Files is set.</td>
</tr>
<tr>
<td>FilterFavoritesFile</td>
<td>Specifies the filter favorites file, as a string.</td>
</tr>
<tr>
<td>Font</td>
<td>Sets the font for the records and the heading in the control.</td>
</tr>
<tr>
<td>FontColor</td>
<td>Sets the font color for the view of records in the Alarm Pareto control.</td>
</tr>
<tr>
<td>HorizontalChart</td>
<td>Shows the chart as horizontal bars. If HorizontalChart is disabled, the chart shows vertical bars.</td>
</tr>
<tr>
<td>MaxRecords</td>
<td>Returns or sets a value that specifies the maximum records to be retrieved at a given time.</td>
</tr>
</tbody>
</table>
## Property Name

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>NoMatchMessage</td>
<td>Sets the message that appears when there is no data to be processed for the Alarm Pareto control.</td>
</tr>
<tr>
<td>QueryTimeZone</td>
<td>Sets the time zone to either UTC Time or Origin Time.</td>
</tr>
<tr>
<td>ServerName</td>
<td>Returns the current server name.</td>
</tr>
<tr>
<td>ShowCountPercentage</td>
<td>If selected, shows the count for each bar as a percentage of the total count. If not selected, shows the actual count for each bar.</td>
</tr>
<tr>
<td>ShowNodeName</td>
<td>Sets the Alarm Pareto control to show the node name in addition to the other information on the bar.</td>
</tr>
<tr>
<td>ShowSelectedInStatusBar</td>
<td>Enables or disables to show the information from the selected bar on the status bar.</td>
</tr>
<tr>
<td>ShowStatusBar</td>
<td>Returns or sets a value that determines whether the status bar is shown.</td>
</tr>
<tr>
<td>ShowTimeinState</td>
<td>Returns or sets a value that determines whether the Alarm Pareto control shows the bars based on the time in which the tag has remained in alarm state. If disabled, the control shows the bars based on the number of times an alarm has occurred.</td>
</tr>
<tr>
<td>SpecificTime</td>
<td>Returns or sets a value that determines whether the control uses the &quot;start time&quot; and &quot;end time&quot; properties, or computes the start time and end time based on the value of the Duration property.</td>
</tr>
<tr>
<td>StartTime</td>
<td>Returns or sets the start date and time.</td>
</tr>
<tr>
<td>User</td>
<td>Returns or sets the User used as the control to connect to the SQL Server.</td>
</tr>
</tbody>
</table>

## Using Alarm Pareto ActiveX Methods

Use the Alarm Pareto ActiveX methods to:

- Control the database connection.
- Retrieve records from the database.
- Retrieving information about specific pareto bars.

For more information about calling methods, see Scripting ActiveX Controls in the InTouch® HMI Scripting and Logic Guide.

## Controlling Database Connections

Use the Connect() method to connect to the alarm database.

**Connect() Method**

Connects to the database configured from the Database tab of the Alarm Pareto control properties.
Syntax

```
Object.Connect()
```

Example

The name of the control is AlarmPareto1.

```
#AlarmPareto1.Connect();
```

## Retrieving Records from the Database

Use the following functions to retrieve records from the database:

- *Refresh()* Method [on page 267]
- *SelectQuery()* Method [on page 267]

### Refresh() Method

Refreshes the control from the database, and if the connection is successful, shows the set of records in the range from 1 to the number defined by the MaxRecords property.

**Syntax**

```
Object.Refresh()
```

**Example**

```
#AlarmPareto1.Refresh();
```

### SelectQuery() Method

Selects a filter that is configured as a query favorite file.

**Syntax**

```
Object.SelectQuery(Filter)
```

**Parameter**

- *Filter*
  - The name of the query filter.

**Example**

The name of the control is AlarmPareto1.

```
#AlarmPareto1.SelectQuery("MyFilter");
```

## Retrieving Information About Specific Pareto Bars

Use the following functions to retrieve information about specific pareto bars:

- *GetItemAlarmName()* Method [on page 267]
- *GetItemAlarmType()* Method [on page 268]
- *GetItemCount()* Method [on page 268]
- *GetItemTotalTime()* Method [on page 268]
- *GetItemEventType()* Method [on page 269]
- *GetItemProviderName()* Method [on page 269]

### GetItemAlarmName() Method

Gets the name of the alarm for a specific bar.
Analyzing Alarm Distribution Across Tags

**Syntax**

```csharp
Object.GetItemAlarmName(BarIndex)
```

**Parameter**

- **BarIndex**
  - The index of the bar.

**Example**

The name of the control is AlarmPareto1.

```
#AlarmPareto1.GetItemAlarmName(1);
```

**GetItemAlarmType() Method**

Gets the type of alarm for a specific bar.

**Syntax**

```csharp
Object.GetItemAlarmType(BarIndex)
```

**Parameter**

- **BarIndex**
  - The index of the bar.

**Example**

The name of the control is AlarmPareto1.

```
#AlarmPareto1.GetItemAlarmType(1);
```

**GetItemCount() Method**

Gets the number of alarms in a bar.

**Syntax**

```csharp
Object.GetItemCount(BarIndex)
```

**Parameter**

- **BarIndex**
  - The index of the bar.

**Example**

The name of the control is AlarmPareto1.

```
#AlarmPareto1.GetItemCount(1);
```

**GetItemTotalTime() Method**

Gets the total time, in seconds, of a tag in an alarm state.

**Syntax**

```csharp
Object.GetItemTotalTime(BarIndex)
```

**Parameter**

- **BarIndex**
  - The index of the bar.

**Example**

The name of the control is AlarmPareto1.

```
#AlarmPareto1.GetItemTotalTime(1);
```
GetItemEventType() Method

Gets the type of event for a specific bar.

Syntax

\[ \text{Object}.\text{GetItemEventType}(\text{BarIndex}) \]

Parameter

\[ \text{BarIndex} \]

The index of the bar.

Example

The name of the control is AlarmPareto1.

\#AlarmPareto1.GetItemEventType(1);

GetItemProviderName() Method

Gets the name of the provider from the generated alarms for a specific bar.

Syntax

\[ \text{Object}.\text{GetItemProviderName}(\text{BarIndex}) \]

Parameter

\[ \text{BarIndex} \]

The index of the bar.

Example

The name of the control is AlarmPareto1.

\#AlarmPareto1.GetItemProviderName(1);

Showing Miscellaneous Information

Use the AboutBox() method to show the About dialog box.

AboutBox() Method

Shows the About dialog box.

Syntax

\[ \text{Object}.\text{AboutBox}() \]

Example

The name of the control is AlarmPareto1.

\#AlarmPareto1.AboutBox();

Error Handling When Using Methods and Properties

The Alarm Pareto control handles run-time error messages based upon the Silent Mode option. For more information, see Configuring the Appearance and Colors of the Alarm Pareto Control on page 255.

If Silent Mode is selected, the Alarm Pareto control does not show run-time error messages. If it is not selected, the alarm display shows error messages. All Alarm Pareto error messages are sent to the Logger.

Using Alarm Pareto ActiveX Events to Trigger Scripts

You can assign QuickScripts to Alarm Pareto control events, such as a mouse click or double-click. When the event occurs, the QuickScript runs.
The Alarm Pareto control supports the following events:

- Click
- DoubleClick
- ShutDown
- StartUp

The Click event has one parameter called ClicknBarIndex, which identifies the index of the bar that is clicked at run time.

The DoubleClick event has one parameter called DoubleClicknBarIndex, which identifies the index of the bar that is double-clicked at run time.

Click and DoubleClick events are zero-based. When Click and/or DoubleClick events are published, the bar count in the display starts with 0.

**Note:** The Alarm Pareto control ignores the user interface methods when they are called from the StartUp event, because the control is not visible yet. These methods include: AboutBox() and Refresh().

For more information about scripting ActiveX events, see Scripting ActiveX Controls in the InTouch® HMI Scripting and Logic Guide.
In This Chapter

About Maintaining the Alarm Database ................................................................. 271
Configuring Purge or Archive Settings .................................................................... 271
Restoring the Alarm Database .................................................................................. 279

About Maintaining the Alarm Database

You manage the alarm database using two InTouch utilities. Use the Alarm DB Purge-Archive utility to remove records from the database permanently or archive them to files. If the database becomes corrupt, use the Alarm DB Restore utility to restore archived records.

The following figure shows how both utilities purge/archive records and then restore them back to the database.

![Alarm Database Diagram]

You must be logged on to the computer as an administrator to use the Alarm DB Purge-Archive utility.

Configuring Purge or Archive Settings

Use the Alarm DB Purge-Archive utility to:

- Select the type of records to purge from the alarm database.
- Purge records automatically on a daily, weekly, or monthly schedule.
- Optionally archive purged database records to files.
- Save the status of archive or purge operations to a log file to troubleshoot problems.
- Show the status of purge or archive operations.

**Important**: The Alarm DB Purge-Archive utility runs as a set of Windows services. To reduce the security exposure of running the Alarm DB Purge-Archive utility with administrator privileges, the user account permissions are set to non-interactive.
Connecting to the Alarm Database

Before you can use the Alarm DB Purge-Archive utility, you must connect to the alarm database.

To configure the database connection

1. Open the Alarm DB Purge-Archive utility. Do the following:
   a. In the Tools view, expand Applications.
   b. Double-click Alarm DB Purge-Archive.

2. Click the Database tab.

   ![Database Configuration Screen]

3. Configure the database connection. Do the following:
   a. In the Authentication list, select the authentication method: SQL Server Authentication or Windows Authentication (default).

   **Note:** When you switch from Windows Authentication to SQL Authentication, a pop up dialog will appear with a recommendation to use Windows Authentication for better application security. To proceed with SQL Authentication, click OK.

   A similar message is also logged in the SMC Log Viewer.
b. In the **Server Name** list, click the node name of the server.

c. In the **Database** box, type the name of the alarm database.

d. In the **User Information** area, type the user name and password of an alarm database user account.

**Note:** The Windows Authentication method uses the credentials of the user currently logged in, and disables the user name and password fields.

4. Click **Test Connection** to test the connection to the database. A message indicates if the connection to the alarm database is successful. Click **OK**.

5. Click **Apply**.

### Configuring How Much Data to Purge from the Server

You can:

- Select the type of alarm records to be purged from the alarm database.
- Optionally archive purged records from the alarm database to files.
- Select the folder location to store the purge log file.

You can select the type of table that needs to be purged, either the AlarmDetail or AlarmConsolidated table.

All data from the day previous to the number specified is purged. Valid entries are 0-9999. If you select 0, all records are purged from the alarm database except the current day’s records.

**To select records to purge**

1. Open the Alarm DB Purge-Archive utility. Do the following:
   a. In the **Tools** view, expand **Applications**.
   b. Double-click **Alarm DB Purge-Archive**.

2. Click the **General** tab.

3. In the **Purge Properties** area, configure the type of records to purge. Do either of the following:
   - Click **Detailed Mode** to purge alarm records that are saved in the database in Detailed mode.
o Click **Consolidated Mode** to purge alarm records that are saved in the database in Consolidated mode.

4. In the **Days Online** box, type the number of days worth of records to retain in the alarm database.

5. Click **Apply**.

### Configuring the Archive of Purged Data

You archive the records purged from the alarm database and then restore them using the Alarm DB Restore utility.

When you purge the alarm database, the Alarm DB Purge-Archive utility automatically creates a set of nine archive files that correspond to the purged alarm database tables. Each file contains the purged records of a single table.

The Alarm DB Purge-Archive utility assigns names to the archive files based upon the table name, date, and time when the purge operation occurred. For example, the name of the archive file for the AlarmMaster table that was purged on June 22, 2007 at 5:30 p.m. is formatted like the following:

AlarmMaster_06222007_1730.txt

#### To configure the archive

1. Open the Alarm DB Purge-Archive utility. Do the following:
   a. In the **Tools** view, expand **Applications**.
   b. Double-click **Alarm DB Purge-Archive**.
2. Click the **General** tab.

3. Select the **Archive** check box.

4. In the **Archive Folder Path** box, type the folder location where archive files should be saved or click the ellipsis button to browse for the location.

5. Select the **Create Unique Folders** check box if you want the archive files to be placed in an individual sub-folder beneath the archive file folder.

6. Click **Apply**.
Configuring Log File Settings

The Alarm DB Purge-Archive utility generates status messages during a purge operation. You can view these messages online from the utility's Status window. The Alarm DB Purge-Archive utility also writes purge messages to the purge log file named WWAlmPurge.log.

The example below shows the messages stored in the log file after a successful purge operation.

```
Starting transaction....
Archiving Table ProviderSession...
Archiving Table Query...
Archiving Table Cause...
Archiving Table Alarm Master...
Archiving Table OperatorDetails...
Archiving Table Alarm Detail...
Archiving Table Comment...
Archiving Table Events...
Archiving Table TagStatus...
Purging records in the database...
Committing....
144 records from AlarmMaster were purged along with the related records from other tables.
```

By default, the purge log file is stored in this folder: C:\Documents and Settings\All Users\Application Data\Wonderware\InTouch. For computers running the Microsoft Windows Vista operating system, the default application folder is C:\Users\UserName\Documents\My InTouch Applications.

You can change the storage location of the purge log file.

The Alarm DB Purge-Archive utility appends new messages to the log file each time a purge occurs.

**To set archive logging**

1. Open the Alarm DB Purge-Archive utility. Do the following:
   a. In the Tools view, expand Applications.
   b. Double-click Alarm DB Purge-Archive.
2. Click the General tab.
3. In the Log File Path box, type the folder location where the purge log file should be placed or click the ellipsis button to browse for the location.
4. Click Apply.

Manually Purging and Archiving the Database

You can purge and archive your alarm database manually. This overrides the activation time and starts the purging and archiving immediately.

The purge operation checks for the presence of an archive file and appends to the same. If the archive file is not present, the file is created as per the naming convention and then used for archiving.

The purge operation does not delete entries in tables such as ProviderSession, Query, and Cause that are linked to the main tables such as AlarmMaster through foreign key constraints. The related records in these tables are written to the files to maintain the data consistency and also retained in the database.

Caution: Manually purge all records (the Purge All Now option) only when the Alarm DB Logger service is stopped. If the purge operation is committed successfully while the Alarm DB Logger service is running, the Alarm DB Logger service stops logging and starts caching records.

To manually purge and archive records from the alarm database

1. Open the Alarm DB Purge-Archive utility. Do the following:
   a. In the Tools view, expand Applications.
   b. Double-click Alarm DB Purge-Archive.
2. Click the Purge/Archive tab.
3. Click **Test Now** to perform a test purge to verify your connection to the database and archive locations.

   The test purge creates empty archive files in the specified archive folder. The **Status** area shows a message that the test was successful.

   ![Status](image)

   The **Test Now** button is available only if you have chosen to archive your purged records. The Archive option is located on the **General** tab.

4. Purge the records from the database. Do either of the following:
   
   - Click **Purge Now** to purge the selected records.
   
   - Click **Purge All Now** to purge all records.

5. To stop a purge, click **Cancel Purge**. If you cancel the purge, the alarm database is rolled back to its original state.

### Setting a Schedule for Automatic Purging

The Alarm DB Purge-Archive utility can automatically purge or archive records from the alarm database at scheduled intervals. You can perform a test purge to verify your connection to the database and target locations and to start and stop purging.

**To set a schedule for automatic purging**

1. Open the Alarm DB Purge-Archive utility. Do the following:
   
   - In the **Tools** view, expand **Applications**.
   
   - Double-click **Alarm DB Purge-Archive**.
2. Click the **Purge/Archive** tab.

3. In the Time Interval area, select a purge interval, either daily, weekly, or monthly.
   - If you click **Weekly** or **Monthly**, a **Day** box appears in the **Activation Time** area for you to specify the day of the week or day of the month.
   - If you click **Daily**, in the **Time** box, configure the time of day that you want the purge/archive operation to start.

4. In the Run As area, click **Normal application** to run the purge-archive utility as an application or click **Windows Service** to run it as a service.
   - For **Windows Service**, either select **Local System account** or specify the username and password for another account under the **This account:** area.

5. Click **Apply** to save your purge and archive settings.

6. Click **Activate** to place the Alarm DB Purge-Archive utility on an automatic purge schedule.

7. Click **Close**.
Restoring the Alarm Database

The Alarm DB Restore utility restores the archived alarm records in the archive files back to your alarm database. The following figure summarizes the steps to restore alarm records to the database.

To restore a database, you must:

- Configure the connection to the alarm database.
- Select which records to restore to the alarm database.
- Restore archived records to the alarm database.

When minimized, the Alarm DB Restore utility appears as an icon in the system tray. When you right-click the icon, a menu shows the following commands:

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Restore</td>
<td>Begins the restoring process.</td>
</tr>
<tr>
<td>Cancel Restore</td>
<td>Cancels the restoring process.</td>
</tr>
<tr>
<td>Clear Status</td>
<td>Clears the status window.</td>
</tr>
<tr>
<td>Hide Window</td>
<td>Minimizes the Alarm DB Restore utility to an icon in the system tray.</td>
</tr>
<tr>
<td>Show Window</td>
<td>Opens and maximizes the Alarm DB Restore utility.</td>
</tr>
<tr>
<td>Exit</td>
<td>Closes the Alarm DB Restore utility.</td>
</tr>
</tbody>
</table>

If you right-click in the Alarm DB Restore utility, the same menu appears.

Configuring the Database Connection

You must select a database to restore the archived data to. If the specified database is not present on the server, you are prompted to create a new database with default server parameters.

To configure a database for restoring

1. Open the Alarm DB Restore utility. Do the following:
   a. In the Tools view, expand Applications.
   b. Double-click Alarm DB Restore.
2. Click the **Configuration** tab.

![Configuration tab](image)

3. Configure the connection to the alarm database. Do the following:
   a. In the **Authentication** list, select the authentication method: SQL Server Authentication or Windows Authentication (default).
   
   **Note:** When you switch from Windows Authentication to SQL Authentication, a pop up dialog will appear with a recommendation to use Windows Authentication for better application security. To proceed with SQL Authentication, click **OK**.

   A similar message is also logged in the SMC Log Viewer.

   b. In the **SQL Server Name** list, click the node name of the server that hosts the alarm database.

   c. In the **Database** box, type the name of the alarm database.

   d. In the **User Information** area, type an alarm database user name and password in the respective boxes.

   e. Click **Test Connection** to test your connection to the database. A message indicates whether the connection to the alarm database is successful or not. Click **OK**.

   **Note:** The Windows Authentication method uses the credentials of the user currently logged in, and disables the user name and password fields.

4. Click **Close**.
Configuring Which Files to Restore

You can select a time period for the records to restore and whether you want the database tables to be recreated.

If you cancel the restore, the database is rolled back to its original state.

**Caution:** If you try to restore archived alarms that are already present in the database, the archived records are not restored. This avoids duplicate alarm/event entries in the database. The Alarm GUID or Event GUID associated with records determines whether an alarm or event is already present in the database.

**To select database records to restore**

1. Open the Alarm DB Restore utility. Do the following:
   a. In the **Tools** view, expand **Applications**.
   b. Double-click **Alarm DB Restore**.
2. Click the **Selection** tab.

3. In the **Folder Path for Archived Files** box, type the full path (up to 255 alphanumeric characters) to the location of the archived files or click the button to locate and select the folder where archived files are stored.

4. In the **Restore files later than (Date/Time)** area, select the date and time to start restoring records to the database.

   The starting date and time are set by default to the current date and time.
5. In the Folder path for log file box, type the full path (up to 255 alphanumeric characters) where the log files are created and stored or click the button to locate and select a folder.

6. If you select the Recreate Tables check box, the tables of the specified alarm database are recreated. Depending on the type of logging you selected for the alarm records contained in the archived files, select:
   - **Detailed** - Recreate the alarm database tables in detailed mode.
   - **Consolidated** - Recreate the alarm database tables in consolidated mode.

   **Important**: Recreating tables overwrites all records currently stored in the alarm database.

7. Click **Restore**.

### Starting a Database Restore Operation

You restore archived database records after you have established the database connection, specified the archived files folder and a time filter.

**To restore database records from an archive**

1. Open the Alarm DB Restore utility. Do the following:
   a. In the **Tools** view, expand **Applications**.
   b. Double-click **Alarm DB Restore**.
2. Click the **Selection** tab.
3. Click **Restore**. A message shows whether the restoration is successful and the number of records restored to the database.

Notes Regarding Hot Backup Pairs .......................................................................................... 298

About Enhancing Plant Security Through Alarm Redundancy

The InTouch Distributed Alarm system issues notifications and receives alarm acknowledgments from applications running on remote nodes within a network. Alarm provider applications store alarm data within their memory. Alarm consumer applications run as clients on other nodes to remotely query, show, and acknowledge alarms from the alarm providers.

You use the Alarm Hot Backup Manager to create a duplicate alarm provider. The following figure shows how the Hot Backup Manager uses a secondary current alarm repository as a backup provider.

You can also run the Hot Backup Manager and the backup provider on the same node, as shown in the following figure:
Understanding Hot Backups

The hot backup provides a single name (hot backup pair name) that points to two alarm providers, the primary and the backup (the hot backup pair). The InTouch HMI alarm consumers can reference this single hot backup pair name and retrieve alarms from either the primary or the backup alarm provider. The following alarm clients support querying the hot backup pair:

- InTouch HMI Alarm DB Logger Manager
- InTouch HMI Alarm Printer
- InTouch HMI Alarm Viewer Control
- ArchestrA Alarm Control

If both provider nodes are operating normally, the alarm consumer receives alarm data from the primary provider. If the primary provider fails, however, the alarm consumer receives alarm data from the backup instead.

The following figure shows how the alarm consumer still receives alarms after the primary alarm provider fails. The alarm consumer still references the hot back pair, but the backup provider provides the alarm data.

Specifying the Alarm Providers for Hot Backup

You can specify any of the following alarm providers:

- InTouch
  
  When you specify InTouch as the alarm provider, the provider must be InTouch for both the primary node and the backup node. However, the alarm group of the backup node can be different from that of the primary node.

- Galaxy
  
  To specify a Galaxy or Galaxy_<GalaxyName> alarm provider, you must configure AppEngine redundancy in the IDE.

- Galaxy_<GalaxyName>
  
  The valid characters for GalaxyName are alphanumeric and special characters $, #, and _.

  When specifying Galaxy_<GalaxyName>, the Galaxy name must be the same for both the primary and the backup node.

  When you specify Galaxy or Galaxy_<GalaxyName> as the alarm provider, the provider of the backup node can be Galaxy or Galaxy_<GalaxyName>.

  The alarm group of the backup node must be the same as that of primary node.
About the Hot Backup Manager

The Hot Backup Manager synchronizes alarm acknowledgements between the primary and backup providers. If an alarm is acknowledged on the primary provider, the same alarm is acknowledged simultaneously on the backup provider.

The Hot Backup Manager:

- Provides a configuration utility to create a backup pair.
- Provides a configuration utility to map alarm records between the primary and backup providers of a hot backup pair.
- Synchronizes alarm acknowledgments between InTouch alarm provider backup pairs.
- Establishes communication between all nodes that belong to a Hot Backup system when the Distributed Alarm system starts and stops.

Using the Alarm Hot Backup Manager in TSE Sessions

You can start only one Alarm Hot Backup Manager using Tools, Applications in a different Terminal Services Edition (TSE) session of WindowMaker.

You can start one Alarm Hot Backup Manager in each TSE session using the Start, Programs shortcut. The last saved configurations will overwrite earlier configurations.

Querying the alarm hot backup pair is supported in a TSE session at run time.

Configuring a Hot Backup Pair

The Alarm Hot Backup Manager creates a backup pair from two host nodes running provider applications. You can start the Hot Backup Manager from WindowMaker. To configure a hot backup pair:

- Create a hot backup pair.
- Set key fields for alarm records.
- Map alarm record key fields.
- Import the alarm record map to Hot Backup Manager.

Creating a Hot Backup Pair

To create a hot backup pair, you:

- Assign a name to the hot backup pair.
- Identify the primary alarm provider.
- Identify the backup alarm provider.

You can also specify a Provacc.ini file that contains the configuration information.

To configure a hot backup pair

1. Open the Alarm Hot Backup Manager. Do the following:
   a. In the Tools view, expand Applications.
b. Double-click **Alarm Hot Backup Manager**.

2. On the **File** menu, click **Open**. Select the Provacc.ini file and then click **OK**.

   By default, the Alarm Hot Backup Manager checks for the Provacc.ini file in the last opened InTouch application folder. You should use the Provacc.ini file located in the InTouch application’s folder. Otherwise, you can create a copy of the Provacc.ini file in another specified folder location and then select it for use with Hot Backup Manager.

3. Click **New Pair**. The **Add New Pair** dialog box appears.

4. In the **Hot Backup Pair Name** box, type a unique name for the new backup pair.

   A pair name can be 32 alphanumeric characters or less. You can use the dollar sign ($), pound sign (#), and underscore (_) character in a pair name.

5. In the **Primary Node** area, configure the primary node. Do the following:
a. In the **Name** box, type the node name of the computer running the primary provider application. The node name must be unique to Hot Backup Manager. An error message appears if you enter a non-existent node name or the node name is used in another hot backup pair.

b. In the **Provider** box, select the alarm provider from the drop-down list. The default is InTouch.

c. In the **Group** box, type the name of the alarm group that queries alarms from the primary provider.

6. In the **Backup Node** area, configure the backup node. Do the following:

   a. In the **Name** box, type the node name of the computer running the backup provider application. This can be the same node that is running the Hot Backup Manager.

   b. In the **Provider** box, select the backup provider, if you specified a Galaxy or Galaxy_\<GalaxyName> alarm provider.

      If you specified Galaxy or Galaxy_\<GalaxyName> as the primary node alarm provider, the backup node provider must be Galaxy or Galaxy_\<GalaxyName>.

      If you specified InTouch as the primary node alarm provider, the backup node provider must be InTouch.

   c. In the **Group** box, type the name of the alarm group that queries alarms from the backup provider.

      If you specified Galaxy or Galaxy_\<GalaxyName> alarm providers, the backup node group must be the same as the primary node group, and cannot be edited.

7. Click **OK**.

8. On the **File** menu, click **Save**.

Setting Alarm Key Fields for a Hot Backup Pair

To synchronize alarm acknowledgements between the primary and backup providers, you must identify a combination of tag alarm record fields. This combination of fields generates a unique mapping key to the paired alarm records stored in each provider's current alarm repository.

You can set alarm key fields and map alarms only for InTouch alarm providers.

The figure below shows a synchronized alarm acknowledgement request based on alarm record fields in a standard query.

A mapping key can be a combination of design-time and run-time alarm records. Design-time alarm records are based upon alarm properties of a tag when it is defined from the Tagname Dictionary.

For example, an alarm name field is known at design time because it takes on the name of the tag defined in the primary and backup node applications. QuickScripts or operators actions define or modify alarm properties stored as records while an application is running.

You can create a map key from any combination of design-time or run-time alarm record fields. The map key must select only a single record from each provider's current alarm repository. The key field must create a unique query.

You use the Hot Backup Manager to create a mapping key list from alarm record fields.

Note: When you specify a Galaxy or Galaxy_<GalaxyName> alarm provider, both the Set KeyFields and the Map Alarms options are disabled.

To create an alarm field mapping list for a hot backup pair

1. Open the Alarm Hot Backup Manager. Do the following:
   a. In the Tools view, expand Applications.
   b. Double-click Alarm Hot Backup Manager.
2. Select a hot backup pair from the list.
3. Click **Set Key Fields**. The **Select Key Fields** dialog box appears.

4. In the **Alarm Record Fields** area, select the alarm record fields that you want to include in the mapping key list.
   
   The selected alarm record fields appear in the **Selected Fields** list box.

5. Select **Design-Time** or **Run-Time** for the alarm record fields you selected.

6. Click **OK**.

7. Restart WindowMaker.

**Creating an Alarm Record Mapping File**

You must map the alarm records of a hot backup pair whenever the primary and backup alarm providers are running different applications. Alarm record mapping establishes a correspondence between dissimilar alarm records of the primary and backup providers. For example, you can map alarm records based upon their assigned InTouch tag names. Although their names may be different, the alarm records are logically consistent between the two provider alarm repositories.

**Note:** Creating an alarm record mapping file is unnecessary if both the primary and backup providers are running the same application. If no mapping file is provided, the Distributed Alarm system assumes the primary and the backup providers are running the same applications with the same alarm records.

Mapping enables alarm acknowledgements to be synchronized between providers running different applications. When the Distributed Alarm system acknowledges an alarm on a provider, it also knows which alarm to acknowledge on the other provider.
The following figure shows alarm record mapping between the two providers of a hot backup pair. In this example, the A and B alarm records of the primary provider are mapped to the corresponding alarm records of the backup provider, MA and MB.

The Hot Backup Manager imports the alarm record map from a comma separated values (CSV) file that you create with Microsoft Excel or a text editor like Notepad. The mapping file includes an ordered list of alarm record fields that associate the corresponding alarm records of the primary and backup providers.

You must specify tag alarm record fields as the headers of the mapping file. The order of the headers within the file must match the alarm record fields shown from the Select Key Fields dialog box. The figure below shows the column headers of an Excel file that match the order of alarm record fields of the Select Key Fields dialog box.
You can create a mapping file that only includes the selected headers of alarm field records used to generate mapping keys. The figure below shows an Excel file that includes only the Name, Class, and Type headers. When you add headers, their order must always match the order of alarm record fields of the Select Key Fields dialog box.

Specify the alarm field records of the primary provider in the left set of columns. Likewise, specify the same records of the backup provider in the right set of columns.

<table>
<thead>
<tr>
<th>Mapping File Column Header</th>
<th>Values Assigned to Alarm Field Records</th>
</tr>
</thead>
<tbody>
<tr>
<td>Group</td>
<td>Name of the alarm group in which the tag has been assigned. An alarm group name cannot contain a blank space.</td>
</tr>
<tr>
<td>Name</td>
<td>Name of the tag whose alarm records are mapped. A tag name cannot contain a blank space.</td>
</tr>
<tr>
<td>Class</td>
<td>Class of alarm assigned to the tag. Possible Class values are:</td>
</tr>
<tr>
<td></td>
<td>• VALUE for a value alarm.</td>
</tr>
<tr>
<td></td>
<td>• DEV for a deviation alarm.</td>
</tr>
<tr>
<td></td>
<td>• ROC for a rate of change alarm.</td>
</tr>
<tr>
<td></td>
<td>• DSC for a discrete alarm.</td>
</tr>
<tr>
<td>Type</td>
<td>Type of alarm condition associated with an alarm class.</td>
</tr>
<tr>
<td></td>
<td>• LOLO, LO, HI, and HIHI for a value alarm</td>
</tr>
<tr>
<td></td>
<td>• MinDev and MajDev for a deviation alarm</td>
</tr>
<tr>
<td></td>
<td>• ROC for a rate of change alarm</td>
</tr>
<tr>
<td></td>
<td>• DSC for a discrete alarm</td>
</tr>
<tr>
<td>Priority</td>
<td>Priority assigned to an alarm condition. Priority must be a number from 1 to 999.</td>
</tr>
<tr>
<td>Value</td>
<td>See the following notes.</td>
</tr>
</tbody>
</table>
Mapping File Column Header | Values Assigned to Alarm Field Records
--- | ---
Limit | See the following notes.
Comment | See the following notes.

Value, Limit, and Comment columns:
- The "Value" and "Limit" column values can be anything other than Null, when the "Class" or "Type" values for that particular record in that particular node are not known.
- The "Value" and "Limit" column values can accept only 1234567890+-eE characters when the Class value for that particular record in that particular node is known as Value, Dev or ROC.
- The "Value" and "Limit" column values can accept only 1234567890+-eE characters when the Type value for that particular record in that particular node is known as LOLO, LO, HI, HIHI, MinDev, MajDev or ROC.
- The "Value" and "Limit" column values can be anything other than Null, when any one of the "Class" or "Type" values for that particular record in that particular node is known as DSC.
- The Comment column values have no limitations.
- All records of the mapping file should be unique. The Hot Backup Manager skips any duplicate records during the import process. You can see details after the import process is completed.

You can combine the field values of alarm records - such as Group, name, and Priority - to generate a "composite mapping key" that uniquely identifies alarm records.

An InTouch Alarm Provider equates the "Name" field to the name of the tag that generated the alarm. Therefore, when given hot backup pair, a mapping key can be generated using the combination of the alarm group name and the tag name.

For example:

<table>
<thead>
<tr>
<th>Provider Node</th>
<th>Backup Node</th>
</tr>
</thead>
<tbody>
<tr>
<td>$System!TagA</td>
<td>$System!TagB</td>
</tr>
</tbody>
</table>

If a provider has a name field and comment field together as a unique field then the mapping key can be a combination of name and comment.

<table>
<thead>
<tr>
<th>Provider Node</th>
<th>Backup Node</th>
</tr>
</thead>
<tbody>
<tr>
<td>tagA!CommentA</td>
<td>tagB!CommentB</td>
</tr>
</tbody>
</table>

This could be true for any other field combination for a third provider.

**Importing an Alarm Record Mapping File**

You can import the contents of the alarm record mapping file to the Hot Backup Manager.

No cross-validation between the Alarm Class and Alarm Type fields is done when you import the mapping file.

**To import alarm records from a mapping file**

1. Open the Alarm Hot Backup Manager. Do the following:
a. In the **Tools** view, expand **Applications**.
b. Double-click **Alarm Hot Backup Manager**.

2. Select the hot backup pair from the list.

3. Click **Map Alarms**. The **Map Alarm Records** dialog box appears.

   ![Map Alarm Records dialog box]

4. Click **Import**. The **Open** dialog box appears. Select the mapping file and click **Open**. The Hot Backup Manager begins importing records from the file.

5. Click **OK** after all mapping records have been imported.

6. On the **File** menu, click **Save**.

7. Restart WindowMaker.

**Troubleshooting Alarm Mapping File Import Problems**

The following situations prevent a file from importing:

- The required number of columns should be filled with values for all the records at the import file. There should never be fewer values or more values for any record.

- The headings at the import file should be the same as that of the headings at the **Select Key Fields** dialog box and should be in the same order.

If a record that is imported has a wrong entry, you are prompted to skip that particular record number or to abort the importing process itself.
Example of a Hot Backup Pair

This section describes a typical working scenario to set up an alarm backup pair. The figure below shows the configuration of a hot backup pair for an InTouch tank farm application. In this example, the InTouch application monitors pump pressure as an alarm condition.

All three computers are running the InTouch HMI. The hot backup pair includes FrmPN as the primary provider and FrmBU as the backup. These two nodes serve as alarm providers within an InTouch Distributed Alarm system.

The Hot Backup Manager runs on the FrmAp node. The InTouch client application runs on FrmAp and consumes alarms from the two providers of the hot backup pair.

The InTouch application running on FrmPN generates two summary alarms for pump inlet and outlet pressure. The two alarms belong to the TnkFrm1 alarm group. The InTouch application running on FrmBU generates two logically equivalent alarms for pump pressure.

When you set up a redundant hot backup pair, you:

- Create a hot backup pair.
- Set the alarm record key fields.
- Create an alarm record mapping file.
- Import the alarm record mapping file.

To create a hot backup pair

1. Open the InTouch application in WindowMaker. In this example, the application runs on the FrmAp node.
2. Open the Alarm Hot Backup Manager. Do the following:
   a. In the Tools view, expand Applications.
   b. Double-click Alarm Hot Backup Manager.
3. Click New Pair. The Add New Pair dialog box appears.
4. Complete the options of the Add New Pair dialog box, as shown in the following figure.

5. Click OK to return to the Alarm Hot Backup Manager dialog box.

6. Keep the Alarm Hot Backup Manager dialog box open within WindowMaker.

You are done with the first step to create a hot backup pair. Next, complete the following procedure to generate a unique mapping key to the paired alarm records stored in each provider’s alarm repository.

To map alarm record key fields

1. Select the hot backup pair in the list.

2. Click Set Key Fields. The Select Key Fields dialog box appears.

   Complete the options of the Select Key Fields dialog box, as shown in the following figure. The alarms between the primary and backup provider are logically consistent but have been assigned different names and belong to different alarm groups. A unique mapping key to records stored in each provider’s alarm repository can be generated by selecting Alarm Group, Alarm Name, Alarm Class, and Alarm Type as Design-Time options.

3. Click OK. When a message appears, click Yes.

   You are done with the second step to create an alarm record mapping key.
In this scenario all three nodes are running InTouch applications. The two provider nodes generate equivalent alarms, but are using different tagnames. The primary provider generates two summary alarms when a pump’s inlet and outlet pressures are too high. The backup provider generates two logically identical alarms for the same pump pressure alarm conditions. Next, complete the following procedure to create a mapping file that associates equivalent records stored in each provider’s alarm repository.

**To create an alarm mapping file**

1. Create a .csv file with Excel or a text editor like Notepad.
2. Enter the names of the file headers in the same order as the alarm record field options of the *Select Key Fields* dialog box.
   
   In this example, the file headers should be ordered by alarm group, alarm name, the class of alarm, and the type of alarm condition.
3. Map the alarms between the two providers on each row of the file.
4. The example of the Excel file below shows how the headers and alarm conditions should be specified for the two providers of the hot backup pair. Save the mapping file to a location accessible to the Hot Backup Manager running on the client node.

![Excel file example](image)

You are done with the third step to create an alarm record mapping file.

In the last step, you import the contents of the alarm mapping file to the Hot Backup Manager. In this example, the client application knows which pump pressure alarm records to acknowledge between the two alarm providers.

**To import an alarm record mapping .csv file**

1. Open the *Alarm Hot Backup Manager*.
   
   The alarm backup pair you created earlier should be listed.
2. Click *Map Alarms*. The *Map Alarm Records* dialog box appears.
3. Click *Import*. The *Open* dialog box appears.
4. Select your mapping file and click **Open**. The **Map Alarm Records** dialog box lists the alarm mapping records from the file.

5. Click **OK**. The Hot Backup Manager begins importing records from the file.

6. Click **OK** after all mapping records have been imported.

You can now run the hot backup application.

**Acknowledgement Synchronization Example**

For this example:

- Alarm Name, Alarm Class, and Alarm Type are selected as design-time key fields.
- Alarm Group is selected as a run-time field.

The following alarm record map file was created using Microsoft Excel.

The Pmp1IP alarm is mapped to the IPPmp1 alarm. Both have a Class of VALUE and a Type of HIHI.

The Pmp1OP alarm is mapped to the OPPmp1 alarm. Both have a Class of VALUE and a Type of Lo.

- When the HiHi alarm for Pmp1IP is acknowledged at the primary alarm node, the acknowledgment also appears on the HiHi alarm for IPPmp1 at the secondary provider node, provided that the alarm group names on both nodes remain the same.
When the Low alarm for Pmp1OP is acknowledged at the primary alarm node, the acknowledgment also appears on the Low alarm for OPPmp1 at the secondary provider node, provided that the alarm group names on both nodes remain the same.

Acknowledgement synchronization occurs only if the design-time and run-time mapping match.

You can select any combination of design-time and run-time alarm record fields for mapping. However, make sure that the mappings do not result in multiple references.

For example, if two alarm record fields such as Class and Priority are selected, it is very possible that more than one alarm matches the criteria. In such a case, the Hot Backup synchronization is not guaranteed to work. In the process of propagating the acknowledgment, a random alarm that matches the criteria may also be picked up, while other matching alarms may be left unacknowledged.

**Notes Regarding Hot Backup Pairs**

- You can use a hot backup only for InTouch 7.11 and later clients.
- Expanded summary alarms or event-oriented alarms are not supported.
- If the Distributed Alarm Display object queries a hot backup pair and then queries the primary provider again separately, the Distributed Alarm Display object shows duplicate records.
- Do not configure a provider as a primary or secondary of more than one hot backup pair.
- If a record at the primary provider is acknowledged and the secondary provider (which was down when the acknowledgment took place) starts up at a later time, the time stamp of the acknowledged record is identical with the record in the primary provider.
- The alarm consumer querying a hot backup pair shows the individual node name as the provider.
- You can choose any combination of design-time and run-time alarm record fields for mapping. However, be sure that the mappings do not result in multiple references.
- When mapping the Value and Limit key fields, the values are rounded off to the fourth decimal place and then mapped.
- An alarm record that does not have the specific combination of design-time and run-time mapping uses the default runtime mapping.
CHAPTER 14

Creating an Alarm Audit Trail

In This Chapter

About Creating an Alarm Audit Trail ................................................................. 299
Acknowledging Alarms that Require Authentication ........................................... 299

About Creating an Alarm Audit Trail

When you configure an InTouch alarm provider to use either operating system or ArchestrA authentication and an alarm occurs, the alarm display contains the full name of the operator in the Operator Full Name column, assuming the operator is logged on.

For example, if a user is registered in the PLANT_FLOOR domain with a user ID of JohnS and a full name of John Smith, the Operator Full Name column contains John Smith. If the alarm is subsequently acknowledged, and the node performing the acknowledgement is set to use operating system or ArchestrA security, the Operator Full Name column is updated to show the full name of the acknowledgement operator. Otherwise, the alarm display shows a computer name concatenated with whatever is in the $Operator tag.

InTouch security can include an operator's full name with alarm acknowledgements. This is also possible on records pertaining to alarm detection. In most organizations, a logon ID is not a person's full name, but rather an abbreviation or role classification.

When you configure operating system authentication for the provider and consumer InTouch nodes:

- The alarm display shows full names when alarms are generated and when acknowledgements are performed.
- The alarm printer prints full names when alarms are generated and when acknowledgements are performed.
- The Alarm DB Logger records domain name, log on user ID, and full user name with each alarm record for both Operator and AckOperator fields. This allows for unique identification even if an organization has two employees with identical full names.
- The Operator field shows the user account in the DomainName\UserName format.

Acknowledging Alarms that Require Authentication

Some industries require that an explicit "signature" or user authentication be performed when acknowledging certain types of alarms. InTouch takes advantage of the Alarm Client control or script functionality to perform this type of authentication operation. The alarm priority is the key factor used to determine if the alarm or alarms to be acknowledged require a specific user signature.

You can configure alarms to require authentication so that users can acknowledge them. Alarms configured with authentication required means that the run time user must enter his or her credentials in order to acknowledge the alarm or group of alarms. If the system is configured with a smart card reader, the user can enter smart card credentials.

This section describes how to acknowledge alarms in WindowViewer that require authentication.
For information about configuring the Alarm Client to require authentication for acknowledging alarms, see the Guide to the ArchestrA Alarm Control, Chapter 3, "Using the Alarm Control at Run Time".

For information about using the SignedAlarmAck() function to configure authentication behavior for acknowledging alarms, see the Creating and Managing ArchestrA Graphics User’s Guide, Chapter 11 "Adding and Maintaining Symbol Scripts”.

**About Acknowledging Alarms in WindowViewer that Require Authentication**

Acknowledging alarms configured for authentication requires the following:

- Security must be enabled for the Galaxy.
- Security must be enabled for a deployed InTouchViewApp.
- The InTouchViewApp must include at least one Alarm Client control configured to display alarms and events and to require a signature (authentication) for alarm acknowledgement, and with minimum and maximum values for the alarm priority range.
- Run-time operators must have the appropriate user name, password, and operational permissions configured within the Galaxy: An operator must have sufficient privileges to run WindowViewer.

Regardless of who is currently logged on as the run-time user for the InTouch application, alarms configured to require a signature for alarm acknowledgement always require user authentication. This does not affect the session of the logged-on user.

**Alarm Acknowledgement Basic Run-Time Behavior**

When the operator selects one or more alarms and attempts to acknowledge them:

- The Alarm Client will check whether it has been configured to require acknowledgement signatures. If so, it checks whether any selected alarm falls within the configured priority range. If so, it requires a signature to acknowledge all the selected alarms.
- If no signature is required, a pop-up acknowledgement dialog displays. It may have a text box for an acknowledgement comment if so configured.
- If the operator credentials are valid, the Alarm Client attempts to acknowledge all of the selected alarms.
- In the Alarm Client grid, the signing user is identified as the person who acknowledged all of the selected alarms.
- The Alarm Client prefixes the text "Signed ACK" at the beginning of the acknowledgement comment to indicate that this was a signed acknowledgement.
- If none of the selected alarms had priority in the required range, the Alarm Client prefixes the text "Std ACK" at the beginning of the acknowledgement comment to indicate that this was a standard acknowledgement.
To acknowledge alarms that require authentication

1. In WindowViewer, select one or more unacknowledged alarms. Right click and select the ack operation you wish to perform. If any of the alarms are configured to require a signature, the Ack Alarms dialog box appears.

![Ack Alarms dialog box]

If Smart Cards are not enabled, the Mode buttons for selecting either Smart Card or Password authentication are disabled.

2. Add a comment in the Comment box if configured for commenting.

3. If you are authenticating using a network user account, the user account options are shown.
   - Do the following.
     a. In the Username box, type your user name. The name of the currently logged-on user is shown by default. If no user is currently logged on, the box is blank.
     b. In the Password box, type the password associated with the user name.
     c. In the Domain box, type the domain name. If the security mode is ArchestrA Galaxy, then the domain displayed is ArchestrA and you cannot modify it.
     d. Click OK.

4. If you are authenticating using a Smart Card, the Smart Card Ack Alarms dialog box appears.

   ![Smart Card Ack Alarms dialog box]

   Do the following to authenticate using a Smart Card.
   - a. In the Certificate list, select your Smart Card certificate. The certificate list appears as domain_name/user_name. For a certificate to appear in the list, Smart Card must be currently inserted into a reader attached to the computer. The certificate of the currently logged-on user is shown by default. If you insert or remove a card while the Secured Write dialog box is open, the certificate list automatically updates.
   - b. In the PIN box, enter the PIN for the Smart Card being used.
   - c. Click OK.
To authenticate using your name, password, and domain instead, click the Mode button. Go to Step 3.
APPENDIX A

Working with the Distributed Alarm Display Object

In This Appendix

About Working With the Distributed Alarm Display Object ......................................................... 303
About the Distributed Alarm Display Object ................................................................. 303
Configuring a Distributed Alarm Display Object at Design Time ......................................... 304
Using a Distributed Alarm Display Object at Run Time ......................................................... 313
Controlling the Distributed Alarm Display Object Using Functions and Dotfields .................. 318

About Working With the Distributed Alarm Display Object

The Distributed Alarm Display object is included in this version of the InTouch HMI to support applications developed with InTouch version 7 and earlier. As the Distributed Alarm Display object is a legacy object, you should use the Alarm Viewer Control instead to create alarm displays with more recent versions of the InTouch HMI.

The Distributed Alarm Display object is included in this version of the InTouch HMI to support applications developed with InTouch version 7 and earlier. As the Distributed Alarm Display object is a legacy object, you should use the Alarm Viewer Control instead to create alarm displays with more recent versions of the InTouch HMI.

About the Distributed Alarm Display Object

The Distributed Alarm Display object provides a single display to show both local and remote alarms.

<table>
<thead>
<tr>
<th>Date</th>
<th>Time</th>
<th>Status</th>
<th>Class</th>
<th>Type</th>
<th>Priority</th>
<th>Name</th>
<th>Group</th>
<th>Provider</th>
</tr>

<td>InTouch</td>
</tr>
</tbody>
</table>

This display object’s features include built-in scroll bars, sizable columns, multiple selection of alarms, a status bar, a shortcut menu, and colors based on alarm priority and state.

The Distributed Alarm Display object includes properties that can set the appearance of the alarm display (including the information that is shown), the colors used for various alarm conditions, and which alarm group and alarm priority levels are shown.

For more information about the display object, see Using a Distributed Alarm Display Object at Run Time on page 313.

Distributed Alarm Display Object Guidelines

Observe the following guidelines when using the Distributed Alarm Display object:
Each display must have an identifier so that any associated QuickScript functions knows which display to modify. This identifier, entered in the Display Name box in the Alarm Configuration dialog box, must be unique for each display.

Displays should not overlap other InTouch objects, such as window controls or graphic objects. You can easily verify this by clicking on the Distributed Alarm Display object in WindowMaker, and checking the display’s "handles." The handles should not touch other objects on the screen.

Displays should be used sparingly. Placing numerous displays on one screen can result in reduced system performance. When possible, limit the number of displays on your window and call further windows with additional displays.

**Configuring a Distributed Alarm Display Object at Design Time**

You can configure:

- General features, such as a status bar, scroll bars, and so on.
- The columns and sorting order.
- The alarm query to use to retrieve alarm records.
- The time format the alarm records are shown in.
- The font and colors for the shown alarm records.
- What run-time users can do in the display, such as resize columns, select alarms, access a shortcut menu, and so on.

**Creating a Distributed Alarm Display Object**

You create a Distributed Alarm Display object just as you would a wizard.

**To create a Distributed Alarm Display object**

1. Click the Wizard tool in the Wizard/ActiveX Toolbar. The Wizard Selection dialog box appears.
2. Select Alarm Displays in the list of wizards.
3. Double-click the Dist. Alarm Display wizard. The dialog box closes and your window reappears with the cursor in the "paste" mode.
4. Click in the window to paste the Distributed Alarm Display object. To size the wizard, drag the selection handles.

You are now ready to configure the display.

**Configuring the Display Properties of the Grid**

For the display grid, you can configure:

- A title bar, status bar, and scroll bars.
- Where new alarms appear in the grid and whether to auto-scroll to them.
- A default message to be shown if there are no alarm records to show.
To configure the appearance of the grid

1. Right-click the Distributed Alarm Display object and then click Properties. The Alarm Configuration dialog box appears.

2. In the Display Name box, type the name for the alarm display. This name must be unique for each alarm display used. This name is used throughout the system for referring to this object for execution of tasks such as alarm acknowledgment and queries.

3. In the New Alarms Appear At area, configure where you want new alarms to appear in the object:
   - Click Top of List to show the most recent alarm at the top of the list.
   - Click Bottom of List to show most recent alarm at the bottom of the list.

4. In the Properties area, configure title bar, status bar, and scroll bars. Do any of the following:
   - Select the Show Titles check box to show the alarm message title bar.
   - Select the Show Status Bar check box to show the status bar.
   - Select the Show Vert Scrollbar check box to show the vertical scroll bar.
   - Select the Show Horz Scrollbar check box to show the horizontal scroll bar.

5. Select the Show Message check box to show a default message if there are no alarm records to show. Type the message in the box.

6. Select the Auto-Scroll to New Alarms check box to have the selection automatically jumps to the new alarm. New alarms are defined as those that are not currently shown within the display object.

7. Click OK.

Controlling Which Features Users Can Access at Run Time

You can allow the run-time user to change the column settings, select alarms, and open the shortcut menu.

Note: You can use script functions to run the commands that appear on the shortcut menu.
To configure the run-time features

1. Right-click the Distributed Alarm Display object and then click **Properties**. The **Alarm Configuration** dialog box appears.

2. Configure the which options are available at run time. Do any of the following:
   - Select the **Allow Runtime Grid Changes** check box to allow the user to change column settings.
   - Select the **Show Context Sensitive Menu** check box to enable the shortcut menu.
   - Select the **Allow Runtime Alarm Selection** check box to allow the user to select alarms.
   - Select the **Use Extended Alarm Selection** check box to allow the user to select multiple alarms by holding down Ctrl or Shift in conjunction with mouse selection. The default is to toggle selection of alarms by simply clicking on them.

3. Click **OK**.

**Configuring Which Alarms to Show**

You can configure the Distributed Alarm Display object to show alarms based on:
- Priority.
- State, such as acknowledged or unacknowledged.
- Type, either summary or historical.

When you configure the alarm query, you use text only. You cannot use tags. Example queries are as follows.

- Full path to Alarm Group:
  ```plaintext
  \Node\InTouch\Group
  ```

- Full path to local Alarm Group
  ```plaintext
  \InTouch\Group
  ```

- Another Group List:
  ```plaintext
  GroupList
  ```

To perform multiple queries, separate each query with a space. For example:
Working with the Distributed Alarm Display Object

InTouch HMI Alarms and Events Guide

The default query properties are only used if you select the Perform Query on Startup check box or if the almDefQuery() function is executed.

To configure which alarms to show

1. Right-click the Distributed Alarm Display object and then click Properties. The Alarm Configuration dialog box appears.

   2. Select the Perform Query on Startup check box.

   3. In the Default Query Properties area, configure the default query for the object.

      o In the From Priority box, type the default minimum alarm priority.

      o In the To Priority box, type the default maximum alarm priority.

      o In the Alarm State list, click the default alarm state to query (All, Unack, Ack).

      o In the Query Type list, click the alarm type, either Summary or Historical.

      o In the Alarm Query box, type the initial alarm query.

4. Click OK.

Configuring a Default Alarm Comment

You can configure a default comment to be used when an operator acknowledges an alarm. If you do not configure a default comment, when the operator acknowledges an alarm, a dialog box appears to let the operator enter a comment. The dialog box can be filled in or left blank.
To configure a default comment

1. Right-click the Distributed Alarm Display object and then click Properties. The Alarm Configuration dialog box appears.

2. Select the Show Context Sensitive Menu check box.

3. Select the Use Default Ack Comment check box and then type the comment text in the box.

4. Click OK.

Configuring the Time Format for Alarm Records

The original alarm time is the date/time stamp of the onset of the alarm. If tag is an I/O tag, then it is the time stamp from the I/O Server if that server is capable of passing time stamps.

To configure the alarm display time format

1. Right-click the Distributed Alarm Display object and then click Properties. The Alarm Configuration dialog box appears.

2. Click the Message tab.
3. In the **Date Format** list, click the format for the date. Available formats are:

<table>
<thead>
<tr>
<th>Selection</th>
<th>Shows</th>
<th>Selection</th>
<th>Shows</th>
</tr>
</thead>
<tbody>
<tr>
<td>DD MMM</td>
<td>28 Feb</td>
<td>MM/DD</td>
<td>02/28</td>
</tr>
<tr>
<td>DD MM YYYY</td>
<td>28 Feb 2007</td>
<td>MM/DD/YY</td>
<td>02/28/07</td>
</tr>
<tr>
<td>DD/MM</td>
<td>28/07</td>
<td>MMM DD</td>
<td>Feb 28</td>
</tr>
<tr>
<td>DD/MM/YYYY</td>
<td>28/02/07</td>
<td>MMM DD YYYY</td>
<td>Feb 28 2007</td>
</tr>
<tr>
<td>YY/MM/DD</td>
<td>07/02/28</td>
<td>YYYY/MM/DD</td>
<td>2007/02/28</td>
</tr>
</tbody>
</table>

4. In the **Time Format** list, click the format for the time. Use the values in this list as a template to specify the format of the time. For example, to specify the time as 10:24:30 AM, use HH:MM:SS AP. The template characters are as follows:

<table>
<thead>
<tr>
<th>Character</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>AP</td>
<td>Selects the AM/PM format. For example, three o’clock in the afternoon is shown as 3:00 PM. A time without this designation defaults to 24 hour military time format. For example, three o’clock in the afternoon is shown as 15:00.</td>
</tr>
<tr>
<td>HH</td>
<td>Shows the hour the alarm/event occurred.</td>
</tr>
<tr>
<td>MM</td>
<td>Shows the minute the alarm/event occurred.</td>
</tr>
<tr>
<td>SS</td>
<td>Shows the second the alarm/event occurred.</td>
</tr>
<tr>
<td>SSS</td>
<td>Shows the millisecond the alarm/event occurred.</td>
</tr>
</tbody>
</table>

5. In the **Sort Order** area, configure the order in which you want the alarms to be sorted in the object:
   - Click **OAT** to use the original alarm time, which is the date/time stamp of the onset of the alarm.
   - Click **LCT** to use the last alarm change time, which is the date/time stamp of the most recent change of status for the instance of the alarm: onset of the alarm, change of sub-state, return to normal, or acknowledgment.

6. Click **OK**.

### Configuring the Font for Alarm Records

You can set the font for the records and the heading in the control.

**To configure the font properties**

1. Right-click the Distributed Alarm Display object and then click **Properties**. The **Alarm Configuration** dialog box appears.
2. Click the **Message** tab.
3. Click **Select Display Font**. The standard Windows **Font** dialog box appears.
4. Configure the font and then click **OK**.
Configuring the Columns for Alarm Records

You can select the columns to show, specify the column order, and set the column names and widths.

To configure the display column details

1. Right-click the Distributed Alarm Display object and then click Properties. The Alarm Configuration dialog box appears.
2. Click the Message tab.
3. Click Column Management. The Column Details dialog box appears.
4. Select the check box in the Column Name list to show that column in the Distributed Alarm Display object. You must select at least one column. The following table describes the columns:

<table>
<thead>
<tr>
<th>Column</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Date</td>
<td>Shows the date in the format selected from the Message tab.</td>
</tr>
<tr>
<td>Time</td>
<td>Shows the time in the format selected from the Message tab.</td>
</tr>
<tr>
<td>State</td>
<td>Shows the state of the alarm.</td>
</tr>
<tr>
<td>Class</td>
<td>Shows the category of the alarm.</td>
</tr>
<tr>
<td>Type</td>
<td>Shows the alarm type.</td>
</tr>
<tr>
<td>Priority</td>
<td>Shows the alarm priority.</td>
</tr>
<tr>
<td>Name</td>
<td>Shows the alarm/tagname.</td>
</tr>
<tr>
<td>Group</td>
<td>Shows the Alarm Group name.</td>
</tr>
<tr>
<td>Provider</td>
<td>Shows the name of the alarm provider.</td>
</tr>
<tr>
<td>Value</td>
<td>Shows the value of the tagname when the alarm occurred.</td>
</tr>
<tr>
<td>Limit</td>
<td>Shows the alarm limit value of the tagname.</td>
</tr>
<tr>
<td>Operator</td>
<td>Shows the logged-on operator’s ID associated with the alarm condition.</td>
</tr>
</tbody>
</table>
### Column Description

<table>
<thead>
<tr>
<th>Column</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Comment</strong></td>
<td>Shows the tagname comment. This comment is typed in the Alarm Comment box when the tagname’s alarm was defined in the database.</td>
</tr>
</tbody>
</table>

5. To rearrange the columns, select the column name and use the Move Up and Down arrow buttons. The column name appearing at the top of the Column Details dialog box is the column shown to the furthest left of the alarm display.

6. To edit the column name and width, select a column name and then click **Edit**. The **Edit** dialog box appears for that column.

   a. In the **New Name** box, type a new name if you want to show a column name other than the default column name.

   b. In the **New Width** box, type in a default column width. The column width can range from 1 to 999 pixels. The default column width is 100 pixels.

   c. Click **OK** in the **Edit** dialog box.

7. Click **OK** in the Column Details dialog box.

8. Click **Apply**.

### Configuring Colors for Alarm Records

You can configure colors for various parts of the Distributed Alarm Display object, such as the background color and the color of selected records. You can also configure different colors for alarm records of different ranges.

**To configure the alarm display colors**

1. Right-click the Distributed Alarm Display object and then click **Properties**. The Alarm Configuration dialog box appears.
2. Click the **Color** tab.

![Alarm Configuration Window](image)

3. In the **General** area, click each color box to open the InTouch color palette. Click the color that you want to use for each of the following:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Window</td>
<td>Sets the display background color.</td>
</tr>
<tr>
<td>Grid</td>
<td>Sets the grid color.</td>
</tr>
<tr>
<td>Selection Back</td>
<td>Sets the highlighted text background color.</td>
</tr>
<tr>
<td>Selection Text</td>
<td>Sets the highlighted text color.</td>
</tr>
<tr>
<td>Title Bar Back</td>
<td>Sets the title bar background color (visible only if the <strong>Show Titles</strong> option is on).</td>
</tr>
<tr>
<td>Title Bar Text</td>
<td>Sets the title bar text color (visible only if the <strong>Show Titles</strong> option is on).</td>
</tr>
<tr>
<td>Alarm Return</td>
<td>Sets the color of returned alarms (alarms that have returned to normal without being acknowledged).</td>
</tr>
<tr>
<td>Event</td>
<td>Sets the color of event alarms.</td>
</tr>
</tbody>
</table>

4. In the **Alarm Priority** boxes, type the breakpoint values for the alarm display.

5. Click the **UnAck Alarm** and **Ack Alarm** color boxes to open the InTouch palette. Click the color in the palette that you want to use.

6. Click **OK**.

**Configuring the Display Type**

The Distributed Alarm Display object can show summaries of active alarms or listings of historical alarms.
You can also change the display type dynamically at run time. This can be done, for example, by running the almQuery() script function. The almQuery() script function uses parameters that you can use to set the specified Distributed Alarm Display object (for example: "AlmObj_1") to a specified display type (for example: "Summary"). For more information, see almQuery() Function on page 336.

**To configure the query default**

1. Right-click the Distributed Alarm Display object and then click **Properties**. The **Alarm Configuration** dialog box appears.

2. In the **Query Type** list, click the type of alarm display that you want to use for the run-time default.

3. Click **OK**.

**Using the Distributed Display to Monitor Local Alarms**

You can use the Distributed Alarm Display object to show and acknowledge both local and remote alarms.

**To set up a display to monitor just local alarms**

1. Right-click the Distributed Alarm Display object and then click **Properties**. The **Alarm Configuration** dialog box appears.

2. In the **Alarm Query** box, type: `\InTouch!$System`

   You can substitute any valid alarm group for $System. You can also define an alarm group list containing just \InTouch!$System, and then use this group list instead of a direct reference.

3. Configure the other parameters for the type of display and any filtering your application requires.

**Using a Distributed Alarm Display Object at Run Time**

The Distributed Alarm Display object uses a grid to show the alarm messages. This grid allows you to dynamically size column widths simply by selecting a column handle and dragging it to the desired width. This functionality is available only during run time.

Grid column changes are not saved; therefore, if you make grid column changes and close the window containing the alarm display, the grid columns will again be at their default width upon re-opening that window. You can adjust the default column width in WindowMaker.
The grid allows you to select single or multiple alarms in a list box. The selected alarms can be acknowledged by using the \texttt{almAckSelect()} QuickScript function. When you configure the Distributed Alarm Display object, you can also define the selection behavior to allow either toggle selection (item by item) or multiple selection (holding down CTRL or SHIFT keys in conjunction with a mouse click to select multiple alarms). You can turn off run-time selection.

You can also configure up to eight different colors for each shown alarm message based on the priority of the alarm and whether or not it is acknowledged.

The scroll bars are available if they were turned on at configuration time.

The alarm display object may have controls to page through alarm records, depending on how the control is configured.

**Sizable Display Columns**

The Distributed Alarm Display object uses a grid to hold the alarm messages. At run-time, you can dynamically size the column widths simply by selecting a column and dragging it. You can also double-click on the vertical grid line to automatically size the column. This functionality is available only during run time. Column resizing must be turned on at configuration time.

Grid column changes are not saved when you close the window containing the alarm display.

**Multiple Selection**

You can select a single or multiple alarms in a list box, depending on how the alarm display is configured.

**Alarm Message Colors**

Up to eight different colors can be used for each shown alarm message, based on the priority of the alarm and whether it is acknowledged or not.

**Status Bar**

Depending on how the alarm object is configured, the status bar shows a status message, the current alarm query, and a progress bar.

<table>
<thead>
<tr>
<th>Feature</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Status Message</td>
<td>The status message at the left end of the status bar provides a more detailed description of the current query status.</td>
</tr>
<tr>
<td>Alarm Query</td>
<td>The Alarm Query provides a visual indication of the current alarm query.</td>
</tr>
<tr>
<td>Progress Bar</td>
<td>The update progress bar at the right end of the status bar provides a visual indication of the current query progress.</td>
</tr>
</tbody>
</table>

The left portion of the status bar shows the current status of the control.

These indicators provide an overview of the current state of the display query and provide details about the suppression available in the Distributed Alarm Display object. The right pane of the status bar is red when freeze is in effect and the left pane of the status bar is red when suppression is in effect.

The word "Suppression" shows in the left pane when suppression is in effect.
The status messages are as follows:

<table>
<thead>
<tr>
<th>Status Message</th>
<th>State/Indicator</th>
<th>Progress Bar</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td>No Query</td>
<td>None</td>
</tr>
<tr>
<td>Update Incomplete</td>
<td>Query Incomplete</td>
<td>Blue/Green</td>
</tr>
<tr>
<td>Update Successful</td>
<td>Query Complete</td>
<td>Red</td>
</tr>
<tr>
<td>Suppression</td>
<td>Query name</td>
<td>Solid Blue</td>
</tr>
<tr>
<td>Freeze</td>
<td>Query name</td>
<td>Red</td>
</tr>
</tbody>
</table>

**Shortcut Menu**

Depending on how the alarm object is configured, you can right-click on the object to open a shortcut menu for common commands:

<table>
<thead>
<tr>
<th>Click this command</th>
<th>To do this</th>
</tr>
</thead>
<tbody>
<tr>
<td>Ack Selected</td>
<td>Acknowledge the selected alarm.</td>
</tr>
<tr>
<td>Ack Others</td>
<td>Acknowledge all alarms in the display, or only visible alarms, selected</td>
</tr>
<tr>
<td></td>
<td>groups, selected tagnames, and priorities.</td>
</tr>
<tr>
<td>Suppress Selected</td>
<td>Suppress the selected alarm.</td>
</tr>
<tr>
<td>Suppress Others</td>
<td>Suppress all alarms in the display, or only visible alarms, selected</td>
</tr>
<tr>
<td></td>
<td>tagname, and selected priorities.</td>
</tr>
<tr>
<td>Query Favorites</td>
<td>Opens the <strong>Alarm Query</strong> dialog box, where you can select the query to use.</td>
</tr>
<tr>
<td>Stats</td>
<td>Opens the <strong>Alarm Statistics</strong> dialog box.</td>
</tr>
<tr>
<td>Suppression</td>
<td>Opens the <strong>Alarm Suppression</strong> dialog box.</td>
</tr>
<tr>
<td>Freeze</td>
<td>Freezes the current display.</td>
</tr>
</tbody>
</table>

**Selecting and Configuring Alarm Query Favorites**

Use the **Query Favorites** command on the shortcut menu to quickly select an alarm query from a list of previously defined alarm queries. You can also create new named queries, edit an existing query, or delete an existing query.

*Note:* For multi-line alarm queries appearing in the Distributed Alarm Display, line separations appear as “garbage” characters. This does not affect the function.
To select an alarm query for display

1. At run time, right-click the Distributed Alarm Display and then click Query Favorites. The Alarm Query dialog box appears.

2. In the list of currently defined queries, select the named query to use.

3. Click OK. The Distributed Alarm Display object shows the alarm information for the selected query.

To add a new named query

1. At run time, right-click the Distributed Alarm Display and then click Query Favorites. The Alarm Query dialog box appears.
2. Click Add. The Add Query dialog box appears.

3. Configure the query. Do the following:
   a. In the Name box, type the name for the query.
   b. In the Query box, type the sets of InTouch alarm queries that you want to perform. You can specify one or more alarm providers and groups.
   c. In the From Priority box, type the minimum alarm priority value (1 to 999). In the To Priority box, type the maximum alarm priority value (1 to 999).
   d. In the Alarm State list, click the alarm state that you want to use in the alarm query.
   e. In the Display Type area, click the type of alarms to show. For more information, see Summary Alarms versus Historical Alarms on page 25.

4. Click OK to close the Add Query dialog box.

5. Click OK in the Alarm Query dialog box.

To modify an existing named query
1. At run time, right-click the Distributed Alarm Display and then click Query Favorites. The Alarm Query dialog box appears.
2. In the list of currently defined queries, select the named query to modify.
3. Click Modify. The Modify Query dialog box appears.
4. Make the necessary modifications and then click OK to close the Modify Query dialog box.
5. Click OK on the Alarm Query dialog box.

Note: Modifications are not automatically applied to other Distributed Alarm Display objects that are using the alarm query being modified.

To delete an existing named query
1. At run time, right-click the Distributed Alarm Display and then click Query Favorites. The Alarm Query dialog box appears.
2. In the list of currently defined queries, select the named query to modify.
3. Click Delete. When a message appears, click Yes.
4. Click OK on the Alarm Query dialog box.

Note: Deletion are not automatically applied to other Distribute Alarm Display objects that are using the alarm query being deleted.
Controlling the Distributed Alarm Display Object Using Functions and Dotfields

You can control the Distributed Alarm Display object at run time using functions and .dotfields.

For a list of returned error numbers for functions, see Error Descriptions on page 355.

Getting or Setting Properties

Properties are accessible through the GetProperty X() function, where X is the data type (D for Discrete, I for Integer, and M for Message). For example:

GetPropertyM(ControlName.Property, MsgTag)

For more information on the GetProperty X() functions, see "Built-In Functions" in the InTouch® HMI Scripting and Logic Guide.

When you run the script that includes the GetProperty X() function, the property value is saved to the MsgTag. If multiple rows are selected, the property assigned to MsgTag is the tag value in the first row of the multiple selection.

Acknowledging Alarms

The Distributed Alarm Display object is capable of acknowledging any alarms that it can query (summary display only). The Distributed Alarm Display object includes alarm acknowledgment functions. These functions supplement the .Ack dotfield used to acknowledge local alarms and alarm groups. Use these functions to acknowledge all alarms, shown alarms, and selected alarms.

You can also acknowledge alarms by their characteristics, such as group membership, priority, application name, and tag name.

- almAckAll() Function on page 318
- Controlling the Distributed Alarm Display Object Using Functions and Dotfields on page 318
- almAckGroup() Function on page 319
- almAckPriority() Function on page 320
- almAckRecent() Function on page 320
- almAckTag() Function on page 321
- almAckSelect() Function on page 321
- almAckSelectedGroup() Function on page 322
- almAckSelectedPriority() Function on page 322
- almAckSelectedTag() Function on page 323

almAckAll() Function

Acknowledges all alarms in a current query, including those not currently shown in the Distributed Alarm Display object in summary mode.

Category

Alarms

Syntax

[Result]=almAckAll(ObjectName,Comment);
Arguments

ObjectName
The name of the alarm object. For example, AlmObj_1.

Comment
Alarm acknowledgment comment.

Examples
MessageTag = "Acknowledge All by " + $Operator;
almAckAll("AlmObj_1",MessageTag);

See Also
Ack(), almAckGroup(), almAckTag(), almAckDisplay(), almAckRecent(), almAckSelect(), almAckSelectedGroup(), almAckSelectedPriority(), almAckSelectedTag()

almAckDisplay() Function

Acknowledges only those alarms currently visible in the Distributed Alarm Display object in summary mode.

Category
Alarms

Syntax
[Result=}almAckDisplay(ObjectName,Comment);

Arguments

ObjectName
The name of the alarm object. For example, AlmObj_1.

Comment
Alarm acknowledgment comment.

Example
almAckDisplay("AlmObj_1","Display Acknowledgement");

See Also
Ack(), almAckAll(), almAckGroup(), almAckTag(), almAckDisplay(), almAckRecent(), almAckSelect(), almAckSelectedGroup(), almAckSelectedPriority(), almAckSelectedTag()

almAckGroup() Function

Acknowledges all alarms shown in the named Distributed Alarm object that match the specified provider and group name.

Category
Alarms

Syntax
[Result=}almAckGroup( "ObjectName", ApplicationName, GroupName, Comment);

Arguments

ObjectName
The name of the alarm object. For example, AlmObj_1.

ApplicationName
The name of the Application for example, \
ode1\Intouch
Working with the Distributed Alarm Display Object

GroupName
The name of the InTouch alarm group, such as $System.

Comment
Alarm acknowledgment comment.

Example
```java
MessageTag = “Acknowledge group, Turbines, by ” + $Operator;
almAckGroup(“AlmObj_1”, “\Intouch", “Turbine", MessageTag);
```

**almAckPriority() Function**

Acknowledges all alarms shown in the named Distributed Alarm object as a result of the last query that match the alarm’s application name, alarm group, and priority range.

**Category**
Alarms

**Syntax**
```
[Result=]almAckPriority(ObjectName, ApplicationName, GroupName, FromPri, ToPri, Comment);
```

**Arguments**

- **ObjectName**
The name of the alarm object. For example, AlmObj_1.

- **ApplicationName**
The name of the Application for example, \node1\Intouch

- **GroupName**
The name of the Group for example, $System

- **FromPri**
Starting number of the alarm priority range. For example, 100.

- **ToPri**
Ending number of the alarm priority range. For example, 900.

- **Comment**
Alarm acknowledgment comment.

**Example**
```java
almAckPriority("AlmObj_1", "\node1\Intouch", “Turbines", 10, 100, “Range 10 to 100 acknowledged”);
```

**almAckRecent() Function**

Acknowledges the most recent alarms that have occurred.

**Syntax**
```
[Result=]almAckRecent(ObjectName, Comment)
```

**Arguments**

- **ObjectName**
The name of the alarm object. For example, AlmObj_1.

- **Comment**
Alarm acknowledgment comment.

**Example**
```java
almAckRecent("AlmObj_1", $DateString);
```
**almAckTag() Function**

Acknowledges all alarms shown in the named Distributed Alarm Display object as a result of the last query. The alarm must match the application name, group name, tag name, and priority range specified by the query.

**Category**

Alarms

**Syntax**

```
[Result=]almAckTag("ObjectName", ApplicationName, GroupName, TagName, FromPri, ToPri, Comment);
```

**Arguments**

- **ObjectName**
  The name of the alarm object. For example, AlmObj_1.

- **ApplicationName**
  The name of the application. For example, \node1\Intouch.

- **GroupName**
  The name of the alarm group. For example, $System.

- **TagName**
  The name of the tag whose value is in an alarm state.

- **FromPri**
  Starting number of the alarm priority range. For example, 100.

- **ToPri**
  Ending number of the priority range. For example, 900.

- **Comment**
  Alarm acknowledgment comment.

**Example**

```
almAckTag("AlmObj_1", "\node1\Intouch", "Turbines", "Valvel", 10, 100, "Acknowledged for Valvel");
```

**See Also**

Ack(), almAckAll(), almAckGroup(), almAckDisplay(), almAckRecent(), almAckSelect(), almAckSelectedGroup(), almAckSelectedPriority(), almAckSelectedTag()

**almAckSelect() Function**

Acknowledges only those alarms selected in the Distributed Alarm Display object in summary mode.

**Category**

Alarms

**Syntax**

```
[Result=]almAckSelect(ObjectName, Comment);
```

**Arguments**

- **ObjectName**
  The name of the alarm object. For example, AlmObj_1.

- **Comment**
  Alarm acknowledgment comment.
Example
This example acknowledges only those alarms that occurred during the day shift or the night shift.

```plaintext
IF ($Hour >= 0 and $Hour < 8) THEN
    AckTag = "Night Shift";
ELSE
    AckTag = "Day Shift";
ENDIF;
almAckSelect ("AlmObj_1", AckTag);
```

See Also
Ack(), almAckAll(), almAckGroup(), almAckTag(), almAckDisplay(), almAckRecent(),
almAckSelectedGroup(), almAckSelectedPriority(), almAckSelectedTag()

**almAckSelectedGroup() Function**
Acknowledges all alarms with same provider and group names that have the same group name as one or more of the alarms that are selected within the named Distributed Alarm Display object.

**Category**
Alarms

**Syntax**

```plaintext
[Result=]almAckSelectedGroup(ObjectName, Comment);
```

**Arguments**

- **ObjectName**
  The name of the alarm object. For example, AlmObj_1.

- **Comment**
  Alarm acknowledgment comment.

**Example**

```plaintext
MessageTag = "Acknowledge selected groups by " + $Operator;
almAckSelectedGroup ("AlmObj_1", MessageTag);
```

See Also
Ack(), almAckAll(), almAckGroup(), almAckTag(), almAckDisplay(), almAckRecent(),
almAckSelectedGroup(), almAckSelectedPriority(), almAckSelectedTag()

**almAckSelectedPriority() Function**
Acknowledges all alarms with same provider and group names that have the same priority value as one or more of the alarms that are selected within the named Distributed Alarm Display object. The priorities are calculated from the minimum and maximum priorities of the selected alarm records.

**Category**
Alarms

**Syntax**

```plaintext
[Result=]almAckSelectedPriority(ObjectName, Comment);
```

**Arguments**

- **ObjectName**
  The name of the alarm object. For example, AlmObj_1.

- **Comment**
  Alarm acknowledgment comment.
Example

MessageTag = "Acknowledge selected priorities by " + $Operator;
almAckSelectedPriority ("AlmObj_1", MessageTag);

See Also

Ack(), almAckAll(), almAckGroup(), almAckTag(), almAckDisplay(), almAckRecent(), almAckSelect(), almAckSelectedGroup(), almAckSelectedTag()

**almAckSelectedTag() Function**

Acknowledges all alarms that have the same Tagname from the same provider and group name and having the same priority as one or more of the selected alarms within the named Distributed Alarm Display object. This function works only if InTouch is the alarm provider.

**Category**

Alarms

**Syntax**

[R]esult=] almAckSelectedTag (ObjectName, Comment);

**Arguments**

*ObjectName*

The name of the alarm object. For example, AlmObj_1.

*Comment*

Alarm acknowledgment comment.

**Example**

MessageTag = "Acknowledge selected tagnames by " + $Operator;
almAckSelectedTag ("AlmObj_1", MessageTag);

See Also

Ack(), almAckAll(), almAckGroup(), almAckTag(), almAckDisplay(), almAckRecent(), almAckSelect(), almAckSelectedGroup(), almAckSelectedTag()

**Selecting Alarms**

You can create scripts to select alarms from a Distributed Alarm Display object. You can select all alarms, only selected alarms, or obtain a count of current alarms.

- **almSelectAll() Function** on page 323
- **almUnselectAll() Function** on page 324
- **almSelectionCount() Function** on page 324
- **almSelectGroup() Function** on page 325
- **almSelectItem() Function** on page 325
- **almSelectPriority() Function** on page 325
- **almSelectTag() Function** on page 326

You can also select specific alarms based upon the data source, alarm priority, and InTouch tags.

**almSelectAll() Function**

Toggles the selection of all the alarms in a named Distributed Alarm Display object.
Working with the Distributed Alarm Display Object

Category
Alarms

Syntax

```
[Result=] almSelectAll(ObjectName);
```

Argument

```
ObjectName
The name of the alarm object. For example, AlmObj_1.
```

Example

```
If $AccessLevel > 8000 THEN
    almSelectAll("AlmObj_1");
    almAckSelect("AlmObj_1", "Ack Selected by a Manager");
ENDIF;
```

See Also

almSelectItem(), almSelectGroup(), almSelectPriority(), almSelectTag(), almUnSelectAll()

almUnselectAll() Function

Unselects all selected alarms in a named Distributed Alarm Display object.

Category
Alarms

Syntax

```
[Result=] almUnselectAll(ObjectName);
```

Argument

```
ObjectName
The name of the alarm object. For example, AlmObj_1.
```

Example

```
If $AccessLevel == 9999 THEN
    almAckSelect("AlmObj_1", "Comment"); {This alarm can be acknowledged by only Administrator}
    ELSE
    almUnselectAll("AlmObj_1");
ENDIF;
```

See Also

almSelectAll(), almSelectItem(), almSelectGroup(), almSelectPriority(), almSelectTag()
Example

The AlarmCount tag is assigned the number of alarms selected by the operator from the Distributed Alarm Display object.

```
AlarmCount = almSelectionCount("AlmObj_1");
```

**almSelectGroup() Function**

Toggles the selection of all alarms that are contained by a named Distributed Alarm Display object as a result of the display’s last query and where the resultant alarm contains the same alarm group name.

**Category**

Alarms

**Syntax**

```
[Result=] almSelectGroup(ObjectName, ApplicationName, GroupName);
```

**Argument**

- **ObjectName**
  The name of the alarm object. For example, AlmObj_1.

- **ApplicationName**
  The name of the Application. For example, \node1\Intouch.

- **GroupName**
  The name of the Group. For example, $System.

**Example**

```
almSelectGroup("AlmObj_1","\InTouch","Turbine");
```

**See Also**

almSelectAll(), almSelectItem(), almSelectPriority(), almSelectTag(), almUnSelectAll()

**almSelectItem() Function**

Toggles the selection of the last selected or unselected item in an alarm display object.

**Syntax**

```
[Result=] almSelectItem(ObjectName);
```

**Argument**

- **ObjectName**
  The name of the alarm object. For example, AlmObj_1.

**Example**

```
almSelectItem("AlmObj_1");
```

**See Also**

almSelectAll(), almSelectGroup(), almSelectPriority(), almSelectTag(), almUnSelectAll()

**almSelectPriority() Function**

Toggles the selection of all alarms in a named Distributed Alarm Display object as a result of the display’s last query and where the resultant alarms are within the specified priority range.

**Category**

Alarms
Working with the Distributed Alarm Display Object

Syntax

```plaintext
[Result=] almSelectPriority("ObjectName", ApplicationName, GroupName, FromPri, ToPri);
```

**Argument**

- **ObjectName**
  The name of the alarm object. For example, AlmObj_1.

- **ApplicationName**
  The name of the Application. For example, \node1\Intouch.

- **GroupName**
  The name of the Group. For example, $System.

- **FromPri**
  Starting priority of alarms. For example, 100 or integer tag.

- **ToPri**
  Ending priority of alarms. For example, 900 or integer tag.

**Example**

```plaintext
almSelectPriority("AlmObj_1", "node1\Intouch", "Turbines", 10, 100);
```

**See Also**

almSelectAll(), almSelectItemAt(), almSelectGroup(), almSelectTag(), almUnSelectAll()

**almSelectTag() Function**

Toggles the selection of all alarms in a named Distributed Alarm Display object as a result of the display’s last query and given tag name.

**Category**

Alarms

**Syntax**

```plaintext
[Result=] almSelectTag (ObjectName, ApplicationName, GroupName, TagName, FromPri, ToPri);
```

**Arguments**

- **ObjectName**
  The name of the alarm object. For example, AlmObj_1.

- **ApplicationName**
  The name of the Application. For example, \node1\Intouch.

- **GroupName**
  The name of the Group. For example, $System.

- **TagName**
  The name of the alarm tag.

- **FromPri**
  Starting priority of alarms. For example, 100 or integer tag.

- **ToPri**
  Ending priority of alarms. For example, 900 or integer tag.

**Example**

```plaintext
almSelectTag("AlmObj_1", "node1\Intouch", "Turbines", "Valve1", 10, 100);
```

**See Also**

almSelectAll(), almSelectItemAt(), almSelectGroup(), almSelectPriority(), almUnSelectAll()
Retrieving Information about a Selected Alarm Record

You can create scripts that return information about selected alarms. Use the following dotfields in your script:

- `.AlarmTime Dotfield` on page 327
- `.AlarmDate Dotfield` on page 328
- `.AlarmName Dotfield` on page 328
- `.AlarmValue Dotfield` on page 329
- `.AlarmClass Dotfield` on page 329
- `.AlarmType Dotfield` on page 330
- `.AlarmState Dotfield` on page 331
- `.AlarmLimit Dotfield` on page 331
- `.AlarmPri Dotfield` on page 332
- `.AlarmGroupSel Dotfield` on page 332
- `.AlarmAccess Dotfield` on page 333
- `.AlarmProv Dotfield` on page 334
- `.AlarmOprName Dotfield` on page 334
- `.AlarmOprNode Dotfield` on page 335
- `.AlarmComment Dotfield` on page 335

`.AlarmTime Dotfield`

Returns the time when an alarm occurred. The alarm must be selected in Distributed Alarm Display object in summary mode.

**Category**

Alarms

**Usage**

```plaintext
[ErrorNumber=]GetPropertyM("ObjectName.AlarmTime",TagName);
```

**Parameters**

- `ObjectName`
  
  Name of the Distributed Alarm Display object. For example, AlmObj_1.

- `TagName`
  
  Any message tag.

**Data Type**

String (read-only)

**Example**

In this example, AlmObj_1 is the name of the Distributed Alarm Display object and `almTime` is a memory message tag.

```plaintext
GetPropertyM("AlmObj_1.AlarmTime",almTime);
```

If used in a Touch Pushbutton QuickScript, this statement returns the time when the alarm occurred to the `almTime` tag.
See Also

.AlarmDate Dotfield

Returns the date associated with a selected alarm. The alarm has to be selected by clicking on the Distributed Alarm Display object in summary mode.

Category
Alarms

Usage
[ErrorNumber]=GetPropertyM("ObjectName.AlarmDate",TagName);

Parameters

ObjectName
Name of the Distributed Alarm Display object. For example, AlmObj_1.

TagName
Any message tag.

Data Type
String (read-only)

Example
If used in a Touch Pushbutton QuickScript, this statement returns the date to the almDate tag.
GetPropertyM("AlmObj_1.AlarmDate",almDate);

AlmObj_1 is the name of the Distributed Alarm Display object and almDate is a memory message tag that retrieves the date for the tag associated with the selected alarm.

See Also

.AlarmName Dotfield

Returns the name of the tag associated with a selected alarm. The alarm has to be selected by clicking the Distributed Alarm Display object in summary mode.

Category
Alarms

Usage
[ErrorNumber]=GetPropertyM("ObjectName.AlarmName",TagName);

Parameters

ObjectName
Name of the Distributed Alarm Display object. For example, AlmObj_1.

TagName
Any message tag.

Data Type
String (read-only)
Example

If used in a Touch Pushbutton QuickScript, this statement returns the name of the alarm to `almName`.

```
GetPropertyM("AlmObj_1.AlarmName", almName);
```

Where `AlmObj_1` is the name of the Distributed Alarm Display object and `almName` is a memory message tag that retrieves the name of the tag associated with the selected alarm.

See Also

.AlarmValue Dotfield

Returns the value of the alarm for the tag associated with the selected alarm. The alarm has to be selected by clicking the Distributed Alarm Display object in summary mode.

Category

Alarms

Usage

```
[ErrorNumber=]GetPropertyM("ObjectName.AlarmValue", TagName);
```

Parameters

- `ObjectName`
  Name of the Distributed Alarm Display object. For example, `AlmObj_1`.

- `TagName`
  Any message tag.

Data Type

String (read-only)

Remarks

This function uses a message tag to retrieve the numeric value. This is because the GetProperty functions do not support real numbers. You can use the `StringToReal()` function to assign the result to a real tag.

Example

If used in a Touch Pushbutton QuickScript, this statement returns the value to `almValue`.

```
GetPropertyM("AlmObj_1.AlarmValue", almValue);
```

Where `AlmObj_1` is the name of the Distributed Alarm Display object and `almValue` is a memory message tag containing the alarm value for the tag associated with the selected alarm.

See Also

.AlarmClass Dotfield

Returns the class of alarm for the tag associated with a selected alarm. The alarm must be selected from the Distributed Alarm Display object in summary mode.

Category

Alarms
Usage

\[\text{GetPropertyM("ObjectName.AlarmClass","TagName");}\]

Parameters

- **ObjectName**
  Name of the Distributed Alarm Display object. For example, AlmObj_1.

- **TagName**
  Any message tag.

Data Type

String (read-only)

Example

The following statement returns the alarm class associated with the selected alarm.

\[\text{GetPropertyM("AlmObj_1.AlarmClass",almClass);}\]

AlmObj_1 is the name of the Distributed Alarm Display object and \text{almClass} is a memory message tag containing the class of alarm for the tag associated with the selected alarm.

If used in a Touch Pushbutton QuickScript, this statement returns the alarm class of the alarm to the \text{almClass} tag.

See Also

.AlarmType Dotfield

Returns the alarm type for the tag associated with a selected alarm. The alarm has to be selected by clicking the Distributed Alarm Display object in summary mode.

Category

Alarms

Usage

\[\text{GetPropertyM("ObjectName.AlarmType","TagName");}\]

Parameters

- **ObjectName**
  Name of the Distributed Alarm Display object. For example, AlmObj_1.

- **TagName**
  Any message tag.

Data Type

String (read-only)

Example

If used in a Touch Pushbutton QuickScript, this statement returns the type of the selected alarm to the \text{almType} tag when the operator acknowledges the alarm.

\[\text{GetPropertyM("AlmObj_1.AlarmType",almType);}\]

Where AlmObj_1 is the name of the Distributed Alarm Display object and \text{almType} is a memory message tag containing the alarm type for the tag associated with the selected alarm.
See Also

.AlarmState Dotfield

Returns the state of the selected alarm. The alarm has to be selected by clicking the Distributed Alarm Display object in summary mode.

Category
Alarms

Usage
[ErrorNumber=]GetPropertyM( "ObjectName.AlarmState", TagName);

Parameters

ObjectName
Name of the Distributed Alarm Display object. For example, AlmObj_1.

TagName
Any message tag.

Data Type
String (read-only)

Example
If used in a Touch Pushbutton QuickScript, this statement returns the state of the selected alarm to the almState tag.
GetPropertyM("AlmObj_1.AlarmState",almState);

Where AlmObj_1 is the name of the Distributed Alarm Display object and almState is a memory message tag containing the alarm state for the tag associated with the selected alarm.

See Also

.AlarmLimit Dotfield

Returns the limit for the tag associated with a selected alarm. The alarm has to be selected by clicking the Distributed Alarm Display object in summary mode.

Category
Alarms

Usage
[ErrorNumber=]GetPropertyM ("ObjectName.AlarmLimit",TagName);

Parameters

ObjectName
Name of the Distributed Alarm Display object. For example, AlmObj_1.

TagName
Any message tag.

Data Type
String (read-only)
Remarks
This function uses a message tag to retrieve the numeric value. This is because the GetProperty functions do not support real numbers. You can use the StringToReal() function to assign the result to a real tag.

Example
If used in a pushbutton QuickScript, this statement returns the limit of the selected alarm to the almLimit tag.

```plaintext
GetPropertyM("AlmObj_1.AlarmLimit",almLimit);
```

Where AlmObj_1 is the name of the Distributed Alarm Display object and almLimit is a memory message containing the alarm limit for the tag associated with the selected alarm.

See Also

.AlarmPri Dotfield

Returns the priority (1-999) for the tag associated with a selected alarm. The alarm must be selected by clicking the Distributed Alarm Display object in summary mode.

Category
Alarms

Usage

```plaintext
[ErrorNumber=]GetPropertyM("ObjectName.AlarmPri", TagName);
```

Parameters

- **ObjectName**
  Name of the Distributed Alarm Display object. For example, AlmObj_1.

- **TagName**
  Any message tag.

Data Type
String (read-only)

Example
If used in a Touch Pushbutton QuickScript, this statement returns the alarm priority to the almPrilvl tag.

```plaintext
GetPropertyM("AlmObj_1.AlarmPri",almPrilvl);
```

Where AlmObj_1 is the name of the Distributed Alarm Display object and almPrilvl is a memory message tag containing the priority level of the tag associated with the selected alarm.

See Also

.AlarmGroupSel Dotfield

Returns the alarm group of the tag associated with a selected alarm. The alarm has to be selected by clicking on the Distributed Alarm Display object in summary mode.

Category
Alarms
Usage

[ErrorNumber=]GetPropertyM( "ObjectName.AlarmGroupSel", TagName);

Parameter

ObjectName
Name of the Distributed Alarm Display object. For example, AlmObj_1.

TagName
Any message tag.

Data Type

String (read-only)

Example

If used in a Touch Pushbutton QuickScript, this statement returns the name of the alarm group to the almGroup tag.

GetPropertyM("AlmObj_1.AlarmGroupSel",almGroup);

Where AlmObj_1 is the name of the Distributed Alarm Display object and almGroup is a memory message tag containing the alarm group of the tag associated with the selected alarm.

See Also

GetPropertyM(), .AlarmGroup, .AlarmName

.AlarmAccess Dotfield

Returns the Access Name of the tag associated with a selected alarm. The alarm record must be selected by clicking on the Distributed Alarm Display object in summary mode.

Usage

GetPropertyM("ObjectName.AlarmAccess", TagName);

Parameter

ObjectName
Name of the Distributed Alarm Display object. For example, AlmObj_1.

TagName
Any message tag.

Data Type

String (read-only)

Example

If used in a Touch Pushbutton QuickScript, this statement returns the Access Name of the tag associated with the alarm to the almAccess tag.

GetPropertyM("AlmObj_1.AlarmAccess",almAccess);

Where AlmObj_1 is the name of the Distributed Alarm Display object and almAccess is a memory message tag containing the Access Name of the tag associated with the selected alarm.

See Also

.AlarmProv Dotfield

Returns the alarm provider for the tag associated with a selected alarm. The alarm has to be selected by clicking the Distributed Alarm Display object in summary mode.

Category
Alarms

Usage

\[
\text{[ErrorNumber=}\text{GetPropertyM("ObjectName.AlarmProv", TagName);}\]

Parameter

ObjectName
Name of the Distributed Alarm Display object. For example, AlmObj_1.

TagName
Any message tag.

Data Type
String (read-only)

Example

If used in a Touch Pushbutton QuickScript, this statement returns the provider name to the almProv tag.

\[
\text{GetPropertyM("AlmObj_1.AlarmProv", almProv);}\]

Where AlmObj_1 is the name of the Distributed Alarm Display object and almProv is a memory message tag containing the name of the provider for the tag associated with the selected alarm.

See Also

.AlarmOprName Dotfield

Returns the name of the logged on operator who acknowledged the selected alarm. The alarm has to be selected by clicking the Distributed Alarm Display object in summary mode.

Category
Alarms

Usage

\[
\text{[ErrorNumber=}\text{GetPropertyM("ObjectName.AlarmOprName", TagName);}\]

Parameter

ObjectName
Name of the Distributed Alarm Display object. For example, AlmObj_1.

TagName
Any message tag.

Data Type
String (read-only)

Example

\[
\text{GetPropertyM("AlmObj_1.AlarmOprName", almOprName);}\]

Where AlmObj_1 is the name of the Distributed Alarm Display object and almOprName is a memory message tag containing the name of the operator responding to the alarm associated with the tag.
If used in a Touch Pushbutton QuickScript, this statement returns the name of the operator to the almOprName tag.

**See Also**

**.AlarmOprNode Dotfield**

Returns the operator node for the tag associated with a selected alarm. The alarm must be selected by clicking the Distributed Alarm Display object in summary mode.

When an alarm is acknowledged in a Terminal Services environment, the Operator Node is the name of the client machine that the respective operator established the Terminal Services session from. If the node name cannot be retrieved, the node's IP address is used instead.

**Category**

Alarms

**Usage**

```plaintext
[ErrorNumber=]GetPropertyM( "ObjectName.AlarmOprNode", TagName);
```

**Parameter**

- **ObjectName**
  Name of the Distributed Alarm Display object. For example, AlmObj_1.

- **TagName**
  Any message tag.

**Data Type**

String (read-only)

**Example**

```plaintext
GetPropertyM("AlmObj_1.AlarmOprNode", almOprNode);
```

Where AlmObj_1 is the name of the Distributed Alarm Display object and almOprNode is a memory message tag containing the name of the operator's node for the tag associated with the selected alarm.

If used in a Touch Pushbutton QuickScript, this statement returns the operator's node to the almOprNode tag.

**See Also**

**.AlarmComment Dotfield**

Returns the alarm comment, which is a read/write text string that describes the alarm, not the tag. By default, the comment is empty in a new application.

However, when an old InTouch application is converted to InTouch version 7.11 or later, the tag comment is copied to the .AlarmComment dotfield for backward compatibility.

**Category**

Alarms

**Usage**

```plaintext
[ErrorNumber=]GetPropertyM( "ObjectName.AlarmComment", TagName);
```

Where AlmObj_1 is the name of the Distributed Alarm Display object and AlmComment is a memory message tag containing the comment for the selected alarm.
Parameter

ObjectName
Name of the Distributed Alarm Display object. For example, AlmObj_1.

TagName
Any message tag.

Data Type
String (read-only)

Example
The following example returns the alarm comment for a tag selected in the AlmObj_1 Distributed Alarm Display object and places it in the almComment tag:

```
GetPropertyM("AlmObj_1.AlarmComment", almComment);
```

Setting the Alarm Query

Use the following query functions to retrieve records from the alarm memory.

- `almDefQuery()` Function on page 336
- `almQuery()` Function on page 336
- `almSetQueryByName()` Function on page 337

**almDefQuery() Function**

Performs a query using default properties to update a named Distributed Alarm Display object.

Category
Alarms

Syntax

```
[Result=] almDefQuery(ObjectName);
```

Argument

ObjectName
The name of the Distributed Alarm Display object. For example, AlmObj_1.

Remarks
The default query properties are specified while developing the Distributed Alarm Display object in WindowMaker.

Example

```
almDefQuery("AlmObj_1");
```

See Also
 almQuery(), almSetQueryByName()
Category
Alarms

Syntax

\[ \text{[Result=]} \text{almQuery}(\text{ObjectName}, \text{AlarmList}, \text{FromPri}, \text{ToPri}, \text{State}, \text{Type}); \]

Arguments

ObjectName
The name of the alarm object. For example, AlmObj_1.

AlarmList
Sets the Alarm Query/Name Manager alias to perform the query against, for example, "intouch!$System" or a Message tag.

FromPri
Starting priority of alarms to show. For example, 100 or integer tag.

ToPri
Ending priority of alarms to show. For example, 900 or integer tag.

State
Specifies type of alarms to show. For example, "UnAck" or Message tag. Valid states are All, UnAck or Ack.

Type
The type of alarm records that appear in the updated display:
"Hist" = Historical alarms
"Summ" = Summary alarms

Example
This statement retrieves all historical alarms specified in MyAlarmListGroup with a priority of 500 to 600. The alarms appear in the AlmObj_1 alarm display.

\[ \text{almQuery}("AlmObj_1", "MyAlarmListGroup", 500, 600, "All", "Hist"); \]

In this example, MyAlarmListGroup is an alarm list configured from the Name Manager setup.

See Also
almDefQuery(), almSetQueryByName()

almSetQueryByName() Function

Starts a new alarm query for the named instance of the Distributed Alarm Display object using the parameters from a user-defined query favorite file.

Category
Alarms

Syntax

\[ \text{[Result=]} \text{almSetQueryByName}(\text{ObjectName}, \text{QueryName}); \]

Arguments

ObjectName
The name of the alarm object. For example, AlmObj_1.

QueryName
The name of the query created by using Query Favorites.
Remarks

This is a query for the particular instance of the Distributed Alarm Display object. There may be several such displays on the screen, each with its own query.

Example

This example starts a new query using parameters from the query named "Turbine Queries."

```
almSetQueryByName("AlmObj_1","Turbine Queries");
```

See Also

almQuery(), almDefQuery()

Checking the Current Query Properties

Use the following dotfields to return the status of alarm memory queries.

- `.AlarmGroup Dotfield` on page 338
- `.QueryType Dotfield` on page 339
- `.QueryStateDotfield` on page 339
- `.Successful Dotfield` on page 340
- `.PriFrom Dotfield` on page 341
- `.PriTo Dotfield` on page 341

.AlarmGroup Dotfield

Contains the current query used to populate a Distributed Alarm Display object.

Category

Alarms

Usage

```
[ErrorNumber=]GetPropertyM( "ObjectName.AlarmGroup", TagName);
```

Arguments

- `ObjectName`
  The name of the alarm object. For example, AlmObj_1.

- `TagName`
  Any message tag.

Remarks

This read-only dotfield contains the current alarm query used by the named Distributed Alarm Display object. This query can be a list of alarm groups or direct alarm provider references.

Data Type

String (read-only)

Example

This statement returns the current alarm query used by the AlmObj_1 Distributed Alarm Display object to the `CurrentQuery` tag:

```
GetPropertyM("AlmObj_1.AlarmGroup",CurrentQuery);
```

See Also

GetPropertyM(), .AlarmGroupSel, .AlarmName
.QueryType Dotfield

Shows the current type of alarm query.

Category
Alarms

Usage
[ErrorNumber=]GetPropertyI( "ObjectName.QueryType",TagName);

Arguments
ObjectName
The name of the alarm object. For example, AlmObj_1.

TagName
Any integer tag

Remarks
This read-only dotfield contains the current query type used by a named Distributed Alarm Display object.

Data Type
Integer (read-only)

Valid Values
1 = Historical
2 = Summary

Example
The following statement returns the current query type of the AlmObj_1 Distributed Alarm Display object to the AlmQueryType tag:
GetPropertyI("AlmObj_1.QueryType",AlmQueryType);

See Also
GetPropertyI(), .QueryState

.QueryStateDotfield

Shows the current alarm state query filter.

Category
Alarms

Usage
[ErrorNumber=]GetPropertyI( "ObjectName.QueryState",TagName);

Arguments
ObjectName
The name of the alarm object. For example, AlmObj_1.

TagName
Any integer tag

Remarks
This read-only dotfield contains the current query filter used by a named Distributed Alarm Display object.

Data Type
Integer (read-only)

Valid Values
0 = All
1 = Unacknowledged
2 = Acknowledged

Example
The following statement returns the current query filter of the AlmObj_1 Distributed Alarm Display object to the AlmQueryState tag:
GetPropertyI("AlmObj_1.QueryState", AlmQueryState);

See Also
GetPropertyI(), .QueryType

Successful Dotfield
 Indicates whether the current query is successful or not.

Category
Alarms

Usage
[ErrorNumber=]GetPropertyD("ObjectName.Successful",TagName);

Arguments
ObjectName
The name of the alarm object. For example, AlmObj_1.
TagName
A discrete tag that holds the property value when the function is processed.

Remarks
This read-only dotfield contains the state of the last query used by a named Distributed Alarm Display object.

Data Type
Discrete (read-only)

Valid Values
0 = Error in query
1 = Successful query

Example
The following statement returns the status of the last query of the AlmObj_1 Distributed Alarm Display object to the AlmFlag tag:
GetPropertyD("AlmObj_1.Successful",AlmFlag);

See Also
GetPropertyD()
.PriFrom Dotfield

Returns the minimum value of an alarm priority range used by the current query.

**Category**
Alarms

**Usage**

```
[ErrorNumber=]GetPropertyI("ObjectName.PriFrom", Tagname);
```

**Parameters**

- **ObjectName**
  Name of the Distributed Alarm Display object. For example, AlmObj_1.
- **TagName**
  Any integer tag.

**Data Type**

Integer (read-only)

**Example**

The following statement returns the minimum priority value of the query used by Distributed Alarm Display object AlmObj_1 to the MinPri integer tag:

```
GetPropertyI("AlmObj_1.PriFrom", MinPri);
```

**See Also**
GetPropertyI(), .PriTo, .AlarmPri

.PriTo Dotfield

Contains the maximum value of the alarm priority range used by the current query.

**Usage**

```
[ErrorNumber=]GetPropertyI("ObjectName.PriTo", Tagname);
```

**Parameter**

- **ObjectName**
  Name of the Distributed Alarm Display object. For example, AlmObj_1.
- **TagName**
  An integer tag that holds the property value when the function is processed.

**Data Type**

Integer (read-only)

**Example**

The following statement returns the maximum priority value of the query used by AlmObj_1 Distributed Alarm Display object to the MaxPri integer tag:

```
GetPropertyI("AlmObj_1.PriTo", MaxPri);
```

**See Also**
GetPropertyI(), .PriFrom, .AlarmPri

Checking for Updates to the Distributed Alarm Display Object

Use the following dotfields to find out whether the Distributed Alarm Display object contains all current alarms or if there are pending updates.
Working with the Distributed Alarm Display Object

- `.ListChanged Dotfield` on page 342
- `.PendingUpdates Dotfield` on page 342

**.ListChanged Dotfield**

Indicates whether there are any new alarms or updates for the Distributed Alarm Display object.

**Category**
Alarms

**Usage**

```plaintext
[ErrorNumber=]GetPropertyD("ObjectName.ListChanged", TagName);
```

**Arguments**

- **ObjectName**
  The name of the alarm object. For example, AlmObj_1.

- **TagName**
  A discrete tag that holds the property value when the function is processed.

**Remarks**

This read-only dotfield contains the status about whether there have been any changes that need to be updated in the Distributed Alarm Display object. This property is automatically reset on reading the property.

**Data Type**
Discrete (read-only)

**Valid Values**

0 = No new alarms or updates for the display object
1 = New updates for the display object

**Example**

The following statement returns the status of any new alarms or updates for the AlmObj_1 Distributed Alarm Display object to the AlmDispStat tag:

```plaintext
GetPropertyD("AlmObj_1.ListChanged", AlmDispStat);
```

**See Also**

GetPropertyD()  

**.PendingUpdates Dotfield**

Indicates the number of pending updates to the Distributed Alarm Display object. There are pending updates usually when the display is frozen and new alarm records are created. These do not show, but the pending updates count is increased.

**Category**
Alarms

**Usage**

```plaintext
[ErrorMessage=]GetPropertyI("ObjectName.PendingUpdates", TagName);
```

**Arguments**

- **ObjectName**
  The name of the alarm object. For example, AlmObj_1.
TagName
An integer tag that holds the property value when the function is processed.

Remarks
This read-only dotfield contains the number of pending updates for a named Distributed Alarm Display object. Any value greater than zero indicates the Distributed Alarm Display object has new alarm data. This value is reset each time the object is refreshed.

Data Type
Integer (read-only)

Example
The following statement returns an integer 1 or greater if there are any pending updates for the AlmObj_1 Distributed Alarm Display object to the AlarmPendingUpdates tag:

```
GetPropertyI( "AlmObj_1.PendingUpdates",AlarmPendingUpdates);
```

See Also
GetPropertyI()

Suppressing Alarms
The Distributed Alarm Display object can suppress one or more alarms at an alarm consumer that match exclusion criteria. If an alarm matches the exclusion criteria, it does not appear in the instance of the display.

You can use QuickScript functions to suppress alarms.

- `almSuppressAll()` Function on page 343
- `almUnsuppressAll()` Function on page 344
- `almSuppressDisplay()` Function on page 344
- `almSuppressGroup()` Function on page 344
- `almSuppressPriority()` Function on page 345
- `almSuppressTag()` Function on page 345
- `almSuppressSelected()` Function on page 346
- `almSuppressSelectedGroup()` Function on page 347
- `almSuppressSelectedPriority()` Function on page 347
- `almSuppressSelectedTag()` Function on page 348
- `almSuppressRetain()` Function on page 348
- `.SuppressRetain Dotfield` on page 349

**almSuppressAll() Function**
Suppresses the showing of all current and future instances of the alarms in the current query, including those not currently shown in the Distributed Alarm Display object in summary mode.

**Syntax**

```
[Result=] almSuppressAll(ObjectName);
```

**Argument**

`ObjectName`
The name of the alarm object. For example, AlmObj_1.
Working with the Distributed Alarm Display Object

**Remarks**

This function works like almAckAll(), identifying which alarms to suppress by identifying all alarms that you would see if you looked at the display and scrolled up and down to look at them all.

**Example**

```plaintext
almSuppressAll("AlmObj_1");
```

**See Also**

almSuppressGroup(), almSuppressTag(), almSuppressDisplay(), almSuppressPriority(), almSuppressRetain(), almSuppressSelected(), almSuppressSelectedGroup(), almSuppressSelectedPriority(), almSuppressSelectedTag(), almUnSuppressAll()

---

**almUnsuppressAll() Function**

Clears all suppressed alarms.

**Syntax**

```plaintext
[Result=] almUnsuppressAll(ObjectName);
```

**Argument**

*ObjectName*

The name of the alarm object. For example, AlmObj_1.

**Example**

```plaintext
almUnsuppressAll("AlmObj_1");
```

**See Also**

almSuppressAll(), almSuppressGroup(), almSuppressTag(), almSuppressDisplay(), almSuppressPriority(), almSuppressRetain(), almSuppressSelected(), almSuppressSelectedGroup(), almSuppressSelectedPriority(), almSuppressSelectedTag()

---

**almSuppressDisplay() Function**

Suppresses the showing of current and future occurrences of alarms visible in the Distributed Alarm Display object in summary mode.

**Syntax**

```plaintext
[Result=] almSuppressDisplay(ObjectName);
```

**Argument**

*ObjectName*

The name of the alarm object. For example, AlmObj_1.

**Remarks**

This function works like the corresponding almAckDisplay() function, identifying which alarms to suppress by identifying all alarms that are currently shown.

**Example**

```plaintext
almSuppressDisplay("AlmObj_1");
```

---

**almSuppressGroup() Function**

Suppresses the showing of current and future occurrences of any alarm with the specified provider and group name.

**Syntax**

```plaintext
[Result=] almSuppressGroup(ObjectName, ApplicationName, GroupName);
```
**Argument**

*ObjectName*
The name of the alarm object. For example, AlmObj_1.

*ApplicationName*
The name of the application. For example, \node1\InTouch

*GroupName*
The name of the alarm group. For example, $System

**Example**

```plaintext```
almSuppressPriority("AlmObj_1","\node1\InTouch","Turbi
```

**See Also**

almSuppressAll(), almSuppressTag(), almSuppressDisplay(), almSuppressPriority(),
almSuppressRetain(), almSuppressSelected(), almSuppressSelectedGroup(),
almSuppressSelectedPriority(), almSuppressSelectedTag(), almUnSuppressAll()
Syntax

[Result=] almSuppressTag(ObjectName, ApplicationName, GroupName, TagName, FromPri, ToPri, AlarmClass, AlarmType);

Arguments

ObjectName
The name of the alarm object. For example, AlmObj_1.

ApplicationName
The name of the application. For example, \\node1\InTouch

GroupName
The name of the Group. For example, $System

TagName
The name of the alarm tag.

FromPri
Starting priority of alarms. For example, 100 or Integer tag.

ToPri
Ending priority of alarms. For example, 900 or Integer tag.

AlarmClass
The class of the alarm. For example, "Value."

AlarmType
The alarm type of the alarm. For example, "HiHi."

Example

almSuppressTag("AlmObj_1","\\node1\Intouch","Turbines","Valvel",10,100,"Value","LoLo");

See Also

almSuppressAll(), almSuppressGroup(), almSuppressDisplay(), almSuppressPriority(), almSuppressRetain(), almSuppressSelected(), almSuppressSelectedGroup(), almSuppressSelectedPriority(), almSuppressSelectedTag(), almUnSuppressAll()

almSuppressSelected() Function

Suppresses the showing of current and future occurrences of the alarms selected in the Distributed Alarm Display object in summary mode.

Category

Alarms

Syntax

[Result=] almSuppressSelected(ObjectName);

Arguments

ObjectName
The name of the alarm object. For example, AlmObj_1.

Remarks

This functions works like the almAckSelect() function, identifying the alarms by the ones selected in the display object.

Example

almSuppressSelected("AlmObj_1");
See Also
almSuppressAll(), almSuppressGroup(), almSuppressTag(), almSuppressDisplay(), almSuppressPriority(), almSuppressSelectedGroup(), almSuppressSelectedPriority(), almSuppressSelectedTag(), almUnSuppressAll()

**almSuppressSelectedGroup() Function**

Suppresses the showing of current and future occurrences of the alarms that belong to the same groups of one or more selected alarms having the same provider name within the named Distributed Alarm Display object.

**Category**
Alarms

**Syntax**

```
[Result=] almSuppressSelectedGroup(ObjectName);
```

**Arguments**

- **ObjectName**
  The name of the alarm object. For example, AlmObj_1.

**Remarks**

This function works like the almAckSelectedGroup() function, identifying the alarms that are selected, then identifying the groups to which they belong, and suppressing future occurrences of the alarms from those groups.

**Example**

```
almSuppressSelectedGroup("AlmObj_1");
```

See Also
almSuppressAll(), almSuppressGroup(), almSuppressTag(), almSuppressDisplay(), almSuppressSelected(), almSuppressSelectedPriority(), almSuppressSelectedTag()

**almSuppressSelectedPriority() Function**

Suppresses the showing of current and future occurrences of the alarms that belong to the same priority of one or more selected alarms having the same provider name and Group tag within the named Distributed Alarm Display object.

**Category**
Alarms

**Syntax**

```
[Result=] almSuppressSelectedPriority(ObjectName);
```

**Arguments**

- **ObjectName**
  The name of the alarm object. For example, AlmObj_1.

**Remarks**

The priorities are calculated from the minimum and maximum of the selected alarm records.

This function works like the almAckSelectedPriority() function, identifying the alarms selected in the display, then identifying the corresponding priorities of those alarms, and suppressing future occurrences of alarms with the same priorities.
Example

```plaintext
almSuppressSelectedPriority("AlmObj_1");
```

See Also

`almSuppressAll(), almSuppressGroup(), almSuppressTagName(), almSuppressDisplay(), almSuppressSelected(), almSuppressSelectedGroup(), almSuppressSelectedTag(), almAckSelectedPriority()
```

**almSuppressSelectedTag() Function**

Suppresses the showing of current and future occurrences of any alarm that belongs to the same Tagname name of one or more selected alarms having the same provider name, group name, and priority range.

**Category**

Alarms

**Syntax**

`[Result=] almSuppressSelectedTag(ObjectName);`

**Arguments**

- **ObjectName**
  The name of the alarm object. For example, AlmObj_1.

**Example**

```plaintext
almSuppressSelectedTag("AlmObj_1");
```

**See Also**

`almSuppressAll(), almSuppressGroup(), almSuppressTag(), almSuppressDisplay(), almSuppressSelectedAlarm(), almSuppressSelectedGroup(), almSuppressSelectedPriority(), almAckSelectedTag(), almUnSuppressAll()
```

**almSuppressRetain() Function**

Suppresses all alarms raised by subsequent queries.

**Category**

Alarms

**Syntax**

`[Result=] almSuppressRetain(ObjectName, SuppressionRetainFlag);`

**Arguments**

- **ObjectName**
  The name of the alarm object. For example, AlmObj_1.

- **SuppressionRetainFlag**
  Any discrete or analog tag, 0, or non-zero value. TRUE if suppression information is retained for following queries, FALSE otherwise.

**Remarks**

If the flag is 0 when the alarm query is changed, the suppression filters are removed.

**Example**

```plaintext
almSuppressRetain("AlmObj_1", 0);
```
See Also
almSuppressAll(), almSuppressGroup(), almSuppressTag(), almSuppressDisplay(),
almSuppressPriority(), almSuppressSelected(), almSuppressSelectedGroup(),
almSuppressSelectedPriority(), almSuppressSelectedTag(), almUnSuppressAll()

 SuppressRetain Dotfield

Reads/writes the status of the feature that retains the suppression for the Distributed Alarm Display object.

Category
Alarms

Usage

[ErrorNumber=]GetPropertyD( "ObjectName.SuppressRetain", TagName);
[ErrorNumber=]SetPropertyD( "ObjectName.SuppressRetain", TagName);

Parameters
ObjectName
Name of the Distributed Alarm Display object. For example, AlmObj_1.

TagName
A discrete tag that holds the property value when the script is processed.

Data Type
Discrete (read-write)

Valid Values
0 = Retain Off
1 = Retain On

Example(s)
The following statement sets the status of suppression retainer for the "AlmObj_1" from the SupRtn discrete tag:
SetPropertyD("AlmObj_1.SuppressRetain", SupRtn);

See Also
GetPropertyD(), SetProperty()

Scrolling the Alarm Display

Use the following function and dotfields to scroll the alarm list within the Distributed Alarm Display object vertically or horizontally. You can also freeze the display.

- almMoveWindow() Function on page 349
- .Freeze Dotfield on page 350
- .PrevPage Dotfield on page 351
- .NextPage Dotfield on page 351

almMoveWindow() Function

Scrolls the alarm list of the Distributed Alarm Display object vertically or horizontally.
Category
Alarms

Syntax

```plaintext
[Result=] almMoveWindow(ObjectName, Option, Repeat);
```

Arguments

- **ObjectName**
  The name of the alarm object. For example, AlmObj_1.

- **Option**
  The type of scrolling action to perform:

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>LineDn</td>
<td>One line down.</td>
</tr>
<tr>
<td>LineUp</td>
<td>One line up.</td>
</tr>
<tr>
<td>PageDn</td>
<td>One page down.</td>
</tr>
<tr>
<td>PageUp</td>
<td>One page up.</td>
</tr>
<tr>
<td>Top</td>
<td>To the top of the list.</td>
</tr>
<tr>
<td>Bottom</td>
<td>To the bottom of the list.</td>
</tr>
<tr>
<td>PageRt</td>
<td>One page to the right.</td>
</tr>
<tr>
<td>PageLf</td>
<td>One page to the left.</td>
</tr>
<tr>
<td>Right</td>
<td>To the end of the list (right side).</td>
</tr>
<tr>
<td>Left</td>
<td>To the beginning of the list (left side).</td>
</tr>
</tbody>
</table>

- **Repeat**
  The number of times this operation should be repeated.

Example

```
almMoveWindow("AlmObj_1", "Bottom", 0);
almMoveWindow("AlmObj_1", "LineDn", 3);
almMoveWindow("AlmObj_1", "PageUp", 0);
```

**.Freeze Dotfield**

The `.Freeze` dotfield reads the freeze status or freezes/unfreezes the Distributed Alarm Display object.

Category
Alarms

Usage

```plaintext
[ErrorNumber=] GetPropertyD("ObjectName.Freeze", TagName);
[ErrorNumber=] SetPropertyD("ObjectName.Freeze", TagName);
```

Arguments

- **ObjectName**
  The name of the alarm object. For example, AlmObj_1.
TagName
A discrete tag that holds the property value when the function is processed.

Remarks
A read-write dotfield that contains or changes the freeze status of a Distributed Alarm Display object. When the alarm display object is frozen, the shown alarms cannot be updated nor can new alarms be added. Freeze has no effect on whether the alarms flash or not.

Data Type
Discrete (read-write)

Valid Values
0 = Freeze OFF
1 = Freeze ON

Example
The following statement sets the Freeze property for the "AlmObj_1" from the AlmFreeze discrete tag.

```plaintext
SetPropertyD("AlmObj_1.Freeze",AlmFreeze);
```

See Also
GetPropertyD(), SetPropertyD()

.NextPage Dotfield
Scrolls the Distributed Alarm Display object one page (one screen full of alarms) down.

Category
Alarms

Usage
```
[ErrorNumber=]SetPropertyD("ObjectName.NextPage",0);
```

Arguments
```
ObjectName
The name of the alarm object. For example, AlmObj_1.
```

Remarks
When this property is set, the Distributed Alarm Display object shows the previous page. After the previous page is shown, the variable is automatically set to 1, unless the top of the list has been reached. In this case, the value remains 0.

Data Type
Discrete (read/write)

See Also
Arguments

ObjectName
The name of the alarm object. For example, AlmObj_1.

Remarks
When this property is set, the Distributed Alarm Display object shows the next page. After the next page is shown, the variable is automatically set to 1, unless the bottom of the list has been reached. In this case, the value remains 0.

Data Type
Discrete (read/write)

See Also

Showing Alarm Statistics and Counts

Use the following functions and dotfields to show statistical information about the current Distributed Alarm Display object.

- almShowStats() Function on page 352
- .PageNum Dotfield on page 352
- .TotalPages Dotfield on page 353
- .NumAlarms Dotfield on page 354
- .ProvidersReq Dotfield on page 354
- .ProvidersRet Dotfield on page 355

almShowStats() Function

Shows the Alarm Statistics dialog box of the specified Distributed Alarm Display object.

Category
Alarms

Syntax
[Result=] almShowStats(ObjectName);

Argument

ObjectName
The name of the alarm object. For example, AlmObj_1.

Example
almShowStats("AlmObj_1");

.PageNum Dotfield

Contains the current page number shown in the alarm object.

Category
Alarms

Syntax
[ErrorNumber=] GetPropertyI("ObjectName.PageNum",TagName);
Parameters

ObjectName
Name of the Distributed Alarm Display object. For example, AlmObj_1.

TagName
An integer tag that holds the number of the page currently shown from the Distributed Alarm Display object.

Remarks
This read-only dotfield returns the number of the currently shown page in a named Distributed Alarm Display object.

Data Type
Integer (read-only)

Example
The following statement returns the number of the page currently shown from the AlmObj_1 Distributed Alarm Display object to the AlmPage integer tag:
GetPropertyI("AlmObj_1.PageNum", AlmPage);

See Also

.TotalPages Dotfield

Contains the total number of pages in the Distributed Alarm Display object.

Category
Alarms

Syntax
[ErrorNum=]GetPropertyI("ObjectName.TotalPages", TagName);

Parameters

ObjectName
Name of the Distributed Alarm Display object. For example, AlmObj_1.

TagName
An integer tag that retrieves the total number of alarm pages contained in the named Distributed Alarm Display object.

Remarks
This dotfield returns the total number of alarm pages contained in a named Distributed Alarm Display object. One page equals to all alarms shown in the object on the screen at any given time.

Data Type
Integer (read-only)

Example
The following statement returns the total number of pages contained in the AlmObj_1 Distributed Alarm Display object to the AlmTotalPages integer tag:
GetPropertyI("AlmObj_1.TotalPages", AlmTotalPages);

See Also
GetPropertyI(), NextPage, PrevPage, PageNum
.NumAlarms Dotfield
Contains the number of alarms within a Distributed Alarm Display object.

Category
Alarms

Syntax
[ErrorNum=]GetPropertyI("ObjectName.NumAlarms", Tagname);

Parameters

ObjectName
Name of the Distributed Alarm Display object. For example, AlmObj_1.

TagName
An integer tag that holds the current number of alarms registered in a named Distributed Alarm Display object. This includes not only those alarms shown, but all alarms registered.

Remarks
This read-only dotfield returns the total number of alarms within a Distributed Alarm Display object.

Data Type
Integer (read-only)

Example
The following statement returns the current number of alarms used by the AlmObj_1 Distributed Alarm Display object to the AlarmCount integer tag:
GetPropertyI("AlmObj_1.NumAlarms",AlarmCount);

See Also
GetPropertyI()

.ProvidersReq Dotfield
Contains the number of alarm providers required by the current query used by a named Distributed Alarm Display object.

Category
Alarms

Syntax
[ErrorNumber=]GetPropertyI( "ObjectName.ProvidersReq",TagName);  

Parameters

ObjectName
Name of the Distributed Alarm Display object. For example, AlmObj_1.

TagName
An integer tag that holds the current number of alarm providers registered in a named Distributed Alarm Display object. This includes not only those alarms shown, but all alarms registered.

Data Type
Integer (read-only)

Example
The following statement returns the number of alarm providers required by the current query used by Distributed Alarm Display object "AlmObj_1". This value is written to the TotalProv integer tag:

GetPropertyI("AlmObj_1.ProvidersReq",TotalProv);
GetPropertyI("AlmObj_1.ProvidersReq",TotalProv);

See Also
GetPropertyI(), .Providers Ret

.ProvidersRet Dotfield

Contains the number of alarm providers returned by the current query used by a named Distributed Alarm Display object.

Category
Alarms

Usage
[ErrorNumber=]GetPropertyI ("ObjectName.ProvidersRet",TagName);

Parameters

ObjectName
Name of the Distributed Alarm Display object. For example, AlmObj_1.

TagName
An integer tag that holds the number of alarm providers that have successfully returned their alarms to the named Distributed Alarm Display object.

Remarks
This read-only dotfield contains the number of alarm providers returned by the current query used by a named Distributed Alarm Display object.

Data Type
Integer (read-only)

Example

The following statement returns the number of alarm providers that have successfully returned their alarms to the AlmObj_1 Distributed Alarm Display object. This value is written to the RetProv integer tag:
GetPropertyI("AlmObj_1.ProvidersRet",RetProv);

See Also
GetPropertyI(), .Providers Req

Error Descriptions

The following table describes the error numbers. If a number is returned that is not in this table, the error is an unknown error.

<table>
<thead>
<tr>

Migrating from the Standard Alarm System to the Distributed Alarm System .................. 357

About Migrating from Legacy Alarm Systems

You can migrate your applications built using the Standard Alarm System or AlarmSuite.

Migrating from the Standard Alarm System to the Distributed Alarm System

When you migrate a Standard Alarm system to the Distributed Alarm system, all of the Standard Alarm Displays in the master/slave application are migrated to Distributed Alarm Display objects.

Colors, fonts, the expressions, and the alarm query settings are not migrated. The new Distributed Alarm Display object has the following default query, where node name is the name of the master node:

\nodename\intouch!$system

The acknowledgement and alarm status dotfields continue to work as before. Depending if the I/O tag was configured for NetDDE or SuiteLink, you may need to enable NetDDE. However, you may decide you no longer need separate controls for issuing acknowledgements, as the alarms can now be acknowledged using the Distributed Alarm Display object.
